IRON HORSE TRAIL

Pedestrian and Bicycle Corridor Concept Plan

EXECUTIVE SUMMARY

TRAIL AT SYCAMORE VALLEY ROAD

FIGURE 1

CROSSING AT CROW CANYON ROAD

FIGURE 2

TRAIL AT BOLLINGER CANYON ROAD

FIGURE 3

PURPOSE OF STUDY

The objective of the San Ramon Valley Iron Horse Trail Bicycle Pedestrian Corridor Concept Plan is to study the feasibility of integrating a series of proposed bicycle/pedestrian overcrossings along the Iron Horse Trail with adjacent transit and pedestrian-oriented land use plans. The proposed overcrossings are located at Sycamore Valley Road (Danville), Crow Canyon Road (San Ramon) and Bollinger Canyon Road (San Ramon).

The San Ramon Valley Iron Horse Trail Bicycle Pedestrian Corridor Concept Plan will evaluate the feasibility of constructing overcrossings to improve access and safety for bicyclists and pedestrians along the Iron Horse Trail and to create a pedestrian-friendly environment at the three major arterial crossings. The Plan has involved the development and evaluation of alternative concepts, feasibility, cost, and schedule for the implementation of a preferred concept.

The San Ramon Valley is located in southern Contra Costa County and is situated between the communities of Walnut Creek, Dublin, and the unincorporated areas of Alameda and Contra Costa counties. The San Ramon Valley area is comprised of the city of San Ramon, the town of Danville, and the unincorporated communities of Alamo, Blackhawk and Diablo.

The project area of study extends from Sycamore Valley Road, south across Crow Canyon Road, and terminates at Bollinger Canyon Road. The general character of the trail in the study area is flat and open. The trail corridor width varies from 100' at Sycamore, to 65' on the northern side of Crow Canyon and 50' on the southern side, to 100' at Bollinger Canyon Road.

As the designated Congestion Management Agency (CMA) for Contra Costa County, the Contra Costa Transportation Authority (CCTA) approved the allocation of Transportation Planning and Land Use (T-PLUS) funds for the Iron Horse Trail Corridor Concept Plan; and entered into an agreement with the City of San Ramon to oversee the expenditure of funds and oversight for the study.

Callander Associates was selected to lead the Consultant effort of the feasibility study. The project included the development of a corridor concept plan for bicyclists and pedestrians along the San Ramon Valley portion of the Iron Horse Trail. The consultant team has worked closely with the City of San Ramon, Town of Danville, Contra Costa County, Contra Costa Transportation Authority and East Bay Regional Park District staff's for the duration of the Study.

JOHN BALDWIN ELEMENTARY SCHOOL NEAR SYCAMORE ROAD **FIGURE 4**

ORGANIZATION OF REPORT

This report is organized into three main parts. The first part includes a description of the project context, organization and goals of the report. Sections of the report included in Part 1 are the executive summary, overview and background, and plan overview. The second part includes a discussion of the planning process, basic overcrossing parameters, anticipated benefits, guiding principles, and case studies. Sections of the report included in Part 2 are planning process, and project considerations. The third part touches on the various overcrossing concepts, implementation, costs and anticipated benefits to be realized from construction of the overcrossings. Sections of the report included in Part 3 are major crossing concepts, and implementation.

Sycamore Valley Road Crossing

The northernmost area of the trail at Sycamore Valley Road is primarily surrounded by residences, with downtown Danville located approximately one half mile north of this crossing. The Rose Garden Shopping Center, Sycamore Valley Road Park and Ride Lot, John Baldwin Elementary and Charlotte Wood Middle School are all located close to the trail near this location. The trail crosses Sycamore Valley Road at an angle and pedestrians are required to leave the corridor alignment to utilize a crosswalk at San Ramon Valley Boulevard to the west of the corridor before proceeding.

This crossing is the closest of the three to Interstate 680; however vehicle volumes are lower than at the other locations. It is anticipated that an overcrossing at this location would serve local residents, commuters and shoppers, and increase safety and convenience for trail users.

Crow Canyon Road Crossing

The Crow Canyon Road Crossing is located in a commercial area with many offices and businesses. The PG&E Technology Center occupies the northeastern corner of this intersection. Crow Canyon Commons and Bishop Ranch Business Park are nearby. This location is approximately mid-way between the residential areas to the north and the office parks to the south.

Of the three crossing locations, the Crow Canyon crossing is the only crossing that is not coincident with a street intersection. Pedestrians and bicyclists cross Crow Canyon mid-block, by pressing a pedestrian activated crosswalk button and waiting their turn. Despite traffic engineering practices, lengthy waits for both pedestrians and motorists are unavoidable.

RUNNER AT SYCAMORE VALLEY ROAD - CUTTING ACROSS **FIGURE 5**

EXECUTIVE SUMMARY

WALKERS ON THE TRAIL NEAR BOLLINGER CANYON ROAD FIGURE 6

Crow Canyon has the most vehicle volume at the morning peak hours, and this use is projected to increase. Many trail users turn around at this crossing to avoid waiting for the signal. An overcrossing at this location would improve pedestrian accessibility, safety and traffic operations.

Bollinger Canyon Road Crossing

Approaching the Bollinger Canyon Road Crossing from the north, the character of the area surrounding the trail shifts from midsize office buildings to corporate campuses as exemplified by the Bishop Ranch Business Park, home of AT&T. The Bollinger Canyon Crossing has the highest trail use of the three crossings. Surrounding uses include the Market Place Shopping Center southeast of San Ramon Central Park, Iron Horse Middle School and the San Ramon City Center (at build out).

At this crossing, trail users have the most lanes of traffic to cross, and must wait at the signal. Significant increases in vehicle traffic and trail use are expected at this location, attributable primarily to the development of the City Center. An overcrossing at this location would improve safety and convenience for trail users as well as improve traffic flow on Bollinger Canyon Road.

The City Center has been designated as a Priority Development Area (PDA) by the Association of Bay Area Governments (ABAG). ABAG's community goals for PDA's include: "Improve mobility through coordination of land use, transportation, and planning decisions," and "Foster a regional growth pattern that creates complete communities with ready, close, and safe access to employment, shopping, amenities and services and where transit is in place, well coordinated and available." An overcrossing at Bollinger Canyon Road is consistent with ABAG's goals for PDA's.

BICYCLISTS AT BOLLINGER - CROSSING AGAINST THE SIGNAL FIGURE 7

BICYCLIST AND JOGGER NEAR SYCAMORE VALLEY ROAD FIGURE 8

LINKS TO THE COMMUNITY

The trail throughout the study area provides critical access to adjacent land uses, including the residential areas near Sycamore Valley Road, businesses along Crow Canyon Road, San Ramon Central Park, Marketplace Shopping Center, and offices adjacent to Bollinger Canyon Road. These vital connections are a factor in evaluating the merits of overcrossings at Sycamore, Crow Canyon and Bollinger Canyon roads.

In some instances it may be desirable to maintain at grade crossings in addition to the grade separations. Some destinations are closer to the street frontage and are more easily accessible if an at grade crossing is available.

CURRENT USE

As a component of this study, an evaluation of current and anticipated traffic levels was completed. The study includes an itemized summary of the current at grade crossings. Some of the issues identified include:

1. Long signal lights.
2. Jay-walking.
3. Trail users that turn around.

Collision data reveals that there have been four vehicle/bicycle accidents reported between 2002 and 2007, with three of those occurring at the Crow Canyon Road intersection.

Future use of the trail will be affected by several factors such as employment growth, residential growth, maintenance of the corridor and improvements. The largest increase in trail use is anticipated to occur at Bollinger Canyon Road, with an increase in use levels of approximately 250%. Growth at Crow Canyon Road is expected to be the next highest, with an increase in use levels of approximately 240% during peak hours. Sycamore Valley Road is projected to have an increase in use levels of approximately 150% during peak hours.

OVERVIEW AND BACKGROUND

OVERVIEW AND BACKGROUND OF TRAIL/CORRIDOR

BICYCLIST ON THE IRON HORSE TRAIL

FIGURE 9

The Iron Horse Trail Corridor contains a 10 foot wide paved asphalt path occupying a Right of Way (ROW) previously dedicated to a heavy gauge rail line. The corridor is currently managed by the Contra Costa County Public Works Department, the East Bay Regional Park District and the Contra Costa County Redevelopment Agency. The paved multi-use trail extends 18.5 miles from the Alameda County line, north towards Concord. Previously a Southern Pacific Railroad route on the San Ramon Valley Branch Line, the railroad began operation in the 1890's, but operation decreased as transportation technology changed throughout the twentieth century.

In 1978, Southern Pacific Railroad received federal permission to abandon the line, and the tracks were removed shortly after. Between 1983 and 1989 Contra Costa County obtained state transportation grants to buy the right-of-way from Southern Pacific. The community group, Right of Way Trail Advocates, had an important role in keeping the space as a right-of-way trail.

In response to public wishes, the corridor has been developed into a recreational and commuter trail for walking, jogging and bicycling and also includes space set aside for a future light rail system. The corridor right-of-way varies in width from 30 to 100 feet.

Since the first portions of the trail opened for public use, the Iron Horse Trail has proved popular. Numerous improvements have been implemented over the years including paved trails, pedestrian crossings and bridges. The Ygnacio Valley Road overcrossing in Walnut Creek and development of the Treat Boulevard overcrossing enhance the utility of the public trail. Additional improvements that have enhanced the utility include photo sensors at minor residential intersections in Danville that allow bicyclists to proceed (with caution) at crossings without manual activation of a pedestrian signal.

IRON HORSE TRAIL USERS

FIGURE 10

By virtue of the fact that the corridor was previously a rail route, numerous benefits accrue to the pedestrians and bicyclists using it including: a flat alignment easily negotiated by all, and convenient unimpeded linkages to the urban centers along the corridor. In addition to linking the historic downtowns, the trail also provides connections to more recent improvements including parks, schools, businesses, and intermodal transportation stations.

FIGURE 20

“Overcrossings must be designed with safety and high visibility as a priority with the health, safety and welfare of citizens of the communities foremost.”

Benefits of Pedestrian Overcrossings:

- Improve pedestrian and bicyclist safety
- Improve traffic flow on trails and streets
- Facilitate alternative means of transportation
- Increase recreational opportunities
- Facilitate healthier lifestyles
- Cultivate appreciation of the natural world

BENEFITS OF BICYCLE/PEDESTRIAN OVERCROSSINGS

Overcrossings provide a multitude of benefits. In very tangible ways overcrossings facilitate transportation by enabling bicyclists and pedestrians to more easily negotiate street crossings. In this way they promote and cultivate alternative means of transportation, an increasingly important consideration as we move to a more broad based transportation system that includes alternative means of transportation.

In a no less tangible manner, pedestrian overcrossings can serve to link communities by breaking down the barriers that multiple lane expressways unavoidably create. By erasing these boundaries, overcrossings create larger, stronger communities.

Overcrossings are important for communities because they provide accessibility for all, non-driver and driver, fully able bodied and persons with disabilities alike. Lastly, crossings can be used to foster identity to a place, and can develop a stronger sense of community when designed in its surrounding context.

Overcrossings must be designed with safety and high visibility as a priority with the health, safety and welfare of citizens of the communities foremost. Pedestrian bridges should be comfortable, functional, appropriate and aesthetically pleasing. Overcrossing designs must be responsive to the evident opportunities and constraints at the location.

BICYCLIST AT CROW CANYON FIGURE 21

PLAN OVERVIEW

Actions that foster improved bicycle and pedestrian circulation further the San Ramon Valley's goals of developing attractive travel alternatives and other objectives such as congestion relief and providing better facilities for non-work trips. Bicycle and pedestrian trails and overcrossings expand options for travel related to work, school, shopping, and recreation.

BICYCLE GROUP BETWEEN SYCAMORE AND CROW CANYON FIGURE 22

CHILDREN LEAVING SCHOOL FIGURE 23

PLANNING PROCESS

The San Ramon Valley Iron Horse Trail Bicycle Pedestrian Corridor Concept Plan utilized the following process, which included an existing conditions analysis, Project Development Team (PDT) meetings, stakeholder meetings, site inventory and site walks, trail use/traffic data and analysis, analyzing opportunities and constraints, assessing alternative overcrossing alignments, and providing bridge images to facilitate visualization of the overcrossings.

EXISTING CONDITIONS ANALYSIS

Review of Previous Reports

At project inception planning documents prepared previously related to this study were reviewed. These documents were crucial for understanding the surrounding areas along the trail, in order to develop through overcrossing alignments and concepts. Among the documents reviewed in preparation of this report are:

- “Revised Iron Horse Trail Corridor Concept Plan: Summary of Data Collection, Analysis and Usage Forecasts”, Fehr and Peers. 02/25/08
- “San Ramon City Center Draft Subsequent EIR”, Michael Brandman Associates. 08/13/07
- “Record of Survey of Former Southern Pacific Railroad Right of Way”, Contra Costa County Public Works Department. 12/03
- “Rose Garden Construction Documents”, BCV Architects. 4/22/04
- “The Town of Danville – 2010 - General Plan” 08/03/99.
- “General Plan – The City of San Ramon”, Dyett and Bhatia. 07/01
- “Bollinger Canyon Road Widening Phase 4 – Iron Horse Trail”, Ruggeri-Jensen-Azar. 03/10/08

PROJECT TEAM DEVELOPMENT MEETINGS

Project Team Development meetings were held over a six month period. During this time team members from the City of San Ramon, Town of Danville, Contra Costa County Public Works, East Bay Regional Park District, Contra Costa Transportation Authority, and the consultant team worked together to assess the feasibility of overcrossings and opportunities and constraints involved. See appendix for the PDT meeting summaries.

- PDT #1 (Kick-Off Meeting) – 8/27/07
- PDT #2 – 11/6/2007
- PDT #3 – 1/16/08
- PDT #4 – 2/28/08
- PDT #5 – 3/19/08
- PDT #6 – 4/14/08

STAKEHOLDER MEETINGS

A community meeting was held at the San Ramon Community Center on October 16, 2007. It was attended by many elected and appointed officials of the City of San Ramon, Town of Danville and Contra Costa County. During this meeting the project objectives were reiterated and means of facilitating the project were discussed. Additional community meetings are anticipated with the City of San Ramon and the Town of Danville. These will be an important source of feedback for the final development of the corridor report and bridge concepts.

- Community Input Meeting – 10/16/07

SITE INVENTORY AND SITE WALKS

Conducting thorough site analyses of the various intersections was done to gain knowledge about the crossings' opportunities and constraints. Site visits took place throughout the design process to verify assumptions and further investigate site conditions. Site visits were documented through field notes, site photos, and meeting summaries.

- 5/25/07
Attendees: Callander Associates.
Actions: Initial Observations, General Characteristics of Area
- 9/26/07
Attendees: Callander Associates, Stakeholders.
Actions: Discussion at each crossing. Bike ride along the trail from Sycamore Valley Road to Bollinger Canyon Road. Detailed Site Reconnaissance. Site Inventory - Utilities and Easements mapped. Detailed photo log created.
- 2/29/08
Attendees: Callander Associates.
Actions: Detailed measurements of utilities at crossings. Notes and Observations. Bridge location analysis. Reference photos.
- 4/19/08
Attendees: Callander Associates.
Actions: Reference photos. Notes and observations.

CROW CANYON ROAD

FIGURE 25

COMMUNITY SUPPORT

Community meetings are a component of the project and are considered critical to the development of a publicly responsive study. All meetings were documented and copies of the meeting summaries can be found in the appendix.

Community Meeting #1 included a scoping study, held on 10/16/07. The purpose of the meeting was to discuss the corridor concept report and solicit input from the city, town and county representatives. No concepts were developed prior to the meeting. Goals of the attendees included:

- an expedited project schedule
- discussion of the report development process
- input and clarification of project development
- consideration of establishing prioritization for the crossings

More community meetings will be held at later dates, and these will be an important component in the design of the pedestrian overcrossings.

PROJECT CONSIDERATIONS

CORRIDOR CONTEXT

The Iron Horse Trail between Sycamore Valley Road and Bollinger Canyon Road is surrounded by many different land uses, thereby creating trail use generators. These include residences, schools, parks, employers, retail and others amenities located adjacent to the trail. These places provide the context of the Iron Horse Trail.

Trail Use Generators

Residential

- Adjacent Residents in San Ramon and Danville

Schools

- John Baldwin Elementary School and Park (Danville)
- Charlotte Wood Middle School (Danville)
- Greenbrook Elementary School and Park (Danville)
- Iron Horse Middle School (San Ramon)
- Montevideo Elementary School and Park (San Ramon)
- California High School and Aquatic Center (San Ramon)

Parks

- Osage Station Park (Danville)
- Central Park (San Ramon)
- Danville South Park (Danville)

Employers

- Crow Canyon Commons Office Park and Sunset Office Park (San Ramon)
- Bishop Ranch Business (San Ramon)
- Chevron Corporate Headquarters (San Ramon)
- AT&T (San Ramon)

Retail

- Downtown Danville (Danville)
- Town and Country Shopping Center (Danville)
- Shops at Bishop Ranch (San Ramon)
- Marketplace Shopping Center (San Ramon)
- Rose Garden Shopping Center (Danville)
- Danville Livery and Mercantile (Danville)
- Crow Canyon Shopping Center (San Ramon)

FIGURE 34

BOYS ON SCOOTERS

FIGURE 35

SITE SETTING

Overview of Corridor

The project study area extends from Sycamore Valley Road, south to Bollinger Canyon Road as shown in the Context Map. Locations of uses in the vicinity of the intersections are described according to quadrants; northwest, southwest, northeast and southeast. For purposes of the report the trail is assumed to represent the north-south axis and the cross streets the east-west axis.

The northwest quadrant of the Sycamore Valley Road/Iron Horse Trail intersection is occupied by a Park and Ride facility, with the Rose Garden Shopping Center occupying the southwest quadrant. South of this intersection and along the eastern edge of the trail is the John Baldwin Elementary School. The Charlotte Wood Middle School lies slightly off the trail against El Capitan Drive. Further south along the trail on the east side is the Greenbrook Elementary School, positioned against the trail. It is notable that there are three schools located between the Sycamore and Crow Canyon crossings, therefore these trails provide a significant opportunity for use by older children traveling to and from school. The addition of safe crossings at major intersections would increase the viability of the trail as a means of traveling to and from school.

Between the Crow Canyon and Bollinger Canyon crossings, there are numerous shopping areas and business offices. The Crow Canyon Commons are located on the western side of the Crow Canyon crossing, and the Bishop Ranch Business Park is situated on both sides of the trail, with the majority of the facilities lying to the west side. Iron Horse Middle School is located between the Crow Canyon and Bollinger crossings and San Ramon Central Park is located just north of the Bollinger crossing. At the Bollinger crossing, significant parcels of land have been set aside in anticipation of the City Center project.

To the south past Bollinger are Montevideo Elementary School and California High School. This portion of the trail serves many different destinations such as shopping areas, offices, homes, schools, and parks. Creating strong links would be beneficial for the entire surrounding community.

PROJECT CONSIDERATIONS

BICYCLIST AT
SYCAMORE VALLEY ROAD

FIGURE 36

Eliminating the Barrier Effect

It was observed that many trail users treat the existing at grade crossings as turn-around points. It is assumed that many of these people turn around to avoid crossing vehicular traffic or waiting for a walk signal. On weekday mornings up to 25 percent of trail users turned around when arriving at a crossing. Constructing an elevated overcrossing at any of the proposed locations would reduce this barrier effect.

BICYCLIST AND JOGGER AT
SYCAMORE VALLEY ROAD

FIGURE 37

PEDESTRIANS WAITING TO CROSS
BOLLINGER CANYON ROAD

FIGURE 38

PROJECT CONSIDERATIONS

BICYCLIST AT SYCAMORE VALLEY ROAD

FIGURE 39

VISUAL IMPACTS

Due to the proximity of homes to the various intersections, sensitivity to visibility must be considered. This included views both to and from any proposed structure. This is a significant consideration at Sycamore Valley Road and may also be a consideration at Bollinger Canyon Road depending upon the proximity of residences in the City Center to the crossing. Environmental documentation that would be a component of further studies will address this impact and identify appropriate measures. It is anticipated that sensitivity in structure siting, design and screening can effectively address these concerns.

ACCESS/CIRCULATION

Overcrossings are an important tool for improving access and circulation because they maintain a throughway for trail users. When pedestrians and bicyclists are allowed to move to and from a destination with reduced stops, they will be more encouraged to use the trail as a mode of transportation. This greater mobility will also allow trail users to engage in more activities, including using the trail for recreational purposes, shopping and commuting. Bicycle utility is further enhanced by the relationship of the trail to transit facilities. Busses serving the transit facilities have bicycle racks, further facilitating intermodal transportation.

UTILITIES AND EASEMENTS

There are multiple underground utility easements and right of ways along the Iron Horse Trail. The use of the corridor for the installation of trunk utility lines is consistent with other transit corridors as they typically provide the most unimpeded routes. Because these major utilities are present, careful planning is necessary when locating and designing bridge overcrossings. The various easements located along the Iron Horse Trail include but are not limited to:

- Transit/Light Rail Corridor
- SFPP/Kinder Morgan Gas/Fuel Easement
- Storm Drain Easement
- EBMUD Easement (East Bay Municipal Utility District)
- DERWA Easement (Dublin San Ramon Services District – EBMUD Recycled Water Authority)

SYCAMORE VALLEY ROAD

FIGURE 41

“Based on the planned development, it is estimated that there will be about 3,700 new employees and 1,000 new residents along the corridor within the project limits.”

ILLUSTRATION OF
FUTURE CITY CENTER
(Excerpted from San Ramon City Center,
Draft Subsequent EIR)

FIGURE 42

TRAIL USE

Existing and Future Uses

Trail use data was gathered during October and November, 2007. The data assembled included current vehicle and user counts, and predictions of anticipated use. The detailed data summary, “Iron Horse Trail Corridor Concept Plan: Summary of Data Collection, Analysis, and Usage Forecasts” is included in the appendix.

Data revealed that the vehicle volumes during the peak hours for Crow Canyon Road and Bollinger Canyon Road, were nearly the same. Slightly fewer vehicles cross Sycamore Valley Road. It was determined that the sources of vehicle traffic originated from the adjacent land uses including: residences, schools, parks, retail stores, employers, Park and Ride facilities, medical center, community center, and library.

The future pedestrian growth would lead to increased traffic levels affected by several factors including; employment growth, residential growth, development along the corridor, and changes to the trail. New developments occurring at all locations of the trail crossing such as condominiums, offices, retailers, hotels, cinemas, and libraries are anticipated to increase traffic volumes. The improvements are designed to be integrated with their surrounding areas to facilitate use and accessibility. Based on the planned development, it is estimated that there will be about 3,700 new employees and 1,000 new residents along the corridor within the project limits. The majority of the new jobs and housing are directly associated with the San Ramon City Center project at Bollinger Canyon Road crossing.

The San Ramon City Center project will consist of approximately 2.1 million square feet of retail, hotel, residential, office and civic uses on approximately 44 acres. About 200,000 square feet of existing office space will be demolished for the new development. There will be a City Hall, Police Station, parking structures, and a Regional Transit Center. Full occupancy is anticipated to occur by 2013.

In addition to future development and the proposed overcrossings, other factors that may contribute to increased trail use include, changing values and lifestyles, increased awareness of healthy transportation, interest in recreation, increased traffic congestion and broader advocacy of existing policies and programs including Safe Routes to School initiatives.

PROJECT CONSIDERATIONS

**FIGURE 43:
CITY CENTER PLAN**

PROJECT CONSIDERATIONS

TRAIL AT SYCAMORE -
LOOKING NORTH

FIGURE 44

Sycamore Valley Road Crossing

The width of the Iron Horse Trail corridor at the Sycamore Valley Road crossing is 100'. Within this corridor there is a 34' Transit/Light Rail 'set aside' for possible future transit railway. This 'set aside' occurs at all of the crossings, but is unique as compared to the defined utility easements because of its flexibility. With county approval, the light rail set aside can be shifted within the corridor, as long as a 34' wide corridor is maintained.

A 27' Sanitary Sewer Easement runs along the east side of the corridor. Additional constraints include the Kinder –Morgan Gas/Fuel Line. It is located along the east side of the corridor to the north of the intersection then crosses under the street at a diagonal to continue along the west side of the trail. There is a 10' EBMUD easement on the north eastern side of the trail. Refer to page 20 for easement locations.

Significant opportunities for a pedestrian overcrossing at the Sycamore crossing include; proximity to Interstate 680, adjacency to the Park and Ride facility, proximity to downtown Danville and a large residential population. Requirements include a longer span because the street is not perpendicular to the trail. Additional considerations include the potential visual impacts to the homes that abut the corridor.

THE ROSE GARDEN
SHOPPING CENTER - DANVILLE

SITE ANALYSIS

SYCAMORE VALLEY ROAD

Legend

- Iron Horse Trail
- - - Iron Horse Trail Area
- Bridge Alignment, 14' x 950' (Span - 150', Deck - 10' Ramps - 400' Each)
- ▨ Transit/Light Rail Corridor, 34'
- ▨ SFPP Gas/Fuel Easement
- ▨ Storm Drain Easement
- ▨ EBMUD Easement

Alternative A - (Recommended)

(No modification to Transit/Light Rail alignment)

Pro's

- No conflict with existing easements
- Further from homes

Con's

- 4' overlap with Transit Corridor
- Trail realignment required to accommodate light rail

Alternative B

(Transit/Light Rail Corridor shifted approx 15' south)

Pro's

- No conflict with Light Rail Corridor

Con's

- Conflicts with Storm Drain Easement
- 5' Overlap with EBMUD Easement
- Closer to overhead electrical lines

IRON HORSE TRAIL

Pedestrian and Bicycle Corridor Concept Plan

PROJECT CONSIDERATIONS

CROW CANYON INTERSECTION FIGURE 47

Crow Canyon Road Crossing

The Iron Horse Trail corridor width is narrowest at Crow Canyon Road, with a 65' corridor width to the north of the intersection, and a 50' corridor to the south. As envisioned by Contra Costa County, the 34' light rail corridor would run along the east side of the Iron Horse Trail corridor. The Kinder-Morgan gas line is located along the eastern side of the corridor. A storm drain easement lies along the western edge and directly beneath the existing trail a second storm drain easement is located along the outside, eastern edge of the corridor.

Opportunities for a pedestrian overcrossing at Crow Canyon Road include; substantial improvements to on-street traffic flow. Because the on-grade crossing at Crow Canyon Road is not coincident with a street intersection the signal can be completely eliminated if a pedestrian overcrossing is built. Constraints include: narrow corridor widths, creating less flexibility in alignment. Developing a bridge at this location would benefit trail users as well as vehicles traveling on Crow Canyon Road.

June, 2009

PROJECT CONSIDERATIONS

BOLLINGER CANYON ROAD AND IRON HORSE TRAIL

FIGURE 49

Bollinger Canyon Road Crossing

The width of the Iron Horse Trail Corridor at the Bollinger Canyon Road crossing is 100'. The Kinder-Morgan line occupies the eastern edge of the corridor. Two, 12' storm drain easements, one on the western portion of the easement, and one centered in the corridor are also present. A 12' Dublin San Ramon Services District - EBMUD Recycled Water Authority (DERWA) easement is located near the center of the corridor, and the 34' light rail corridor is shown by the County to be aligned in the center of the corridor.

Opportunities at the Bollinger Canyon crossing include: facilitation of pedestrian/bicycle traffic associated with the development of the City Center. The ability to travel freely between the Central Park, City Center, Market Place Shopping Center, Iron Horse Middle School, and the Bishop Ranch Business Park will be enhanced. The housing that will be added in the area will be added coincident with the bridge and there are no existing residences adjacent to the trail.

IRON HORSE TRAIL

Pedestrian and Bicycle Corridor Concept Plan

PROJECT CONSIDERATIONS

GUIDING PRINCIPLES

Pedestrian Overcrossings at Sycamore, Crow Canyon and Bollinger Canyon Roads meet the objectives and are responsive to stated goals and policies of the City of San Ramon, the Town of Danville, Contra Costa County and the East Bay Regional Park District. By facilitating transportation, the pedestrian overcrossings are consistent with the policies and objectives listed by the Federal Government in the guidelines for T-Plus funded projects. Pedestrian overcrossings are consistent with the referenced entities in the following ways:

Contra Costa County:

- 2003 County Wide Bicycle and Pedestrian Plan - Extending and improving trails, improving safety, encouraging more users. (Chapter 4 - Bicycle Network)
- Contra Costa County General Plan - Increasing opportunities for bicycle transportation and improving facilities. (Section 5.8)

City of San Ramon:

- San Ramon General Plan - Bicycling and walking are key elements of San Ramon's circulation system. The City has an extensive network of bikeways, sidewalks and trails that enhance neighborhood accessibility and help reduce reliance on the private automobile. (Section 5.6)

Town of Danville:

- General Plan - Town of Danville - Trail importance for recreational value and as a means of providing off-street linkages to neighborhoods and areas of interest. (Chapter 4)

East Bay Regional Park District:

- East Bay Regional Park District Master Plan - Mission and Priority statements emphasize the importance of providing a diversified system of parks and trails. (Section 3 - Public Access and Cultural Service)

Transportation Planning and Land Use Solutions (T-Plus) Grant Program:

- Association of Bay Area Governments (ABAG) - Initiative developed by MTC and funded through the Authority to encourage local efforts to design and implement Transportation Oriented Development (TOD) projects. (Contra Costa County Transportation Authority - 2/11/08)

BICYCLIST AT
SYCAMORE VALLEY ROAD

FIGURE 51

“Access to transit can help extend the commute range of bicyclists and pedestrians, and respond to those changes in land use patterns.”

Countywide Bicycle and Pedestrian Plan (CBPP)

“The focus of the CBPP is on encouraging bicycling and walking as transportation, whether for commuting, shopping, or other purposes. Changes in land use and development, and the increasing distance between destinations that have resulted from those changes, have made walking and bicycling less practical for a growing number of people. Bicycle trips are generally shorter than automobile trips, typically less than two miles, while the average walking distance is about a half mile. This statistic suggests that focusing first on facilities that serve these shorter trips might have the greatest “payoffs” in increasing walking and bicycling. And access to transit can help extend the commute range of bicyclists and pedestrians, and respond to those changes in land use patterns. (Transit systems, however, also face an increasingly dispersed live-work pattern that is difficult to serve.)”

“On December 17, 2003, the Contra Costa Transportation Authority (Authority) adopted the CBPP. The Authority has designed the CBPP to outline bicycle and pedestrian needs for Contra Costa; refine the Authority’s goals and strategies as they apply to bicycling and walking; encourage local efforts to improve the environment for bicycling and walking in the communities of Contra Costa; and spur greater interest in and support for bicycling and walking generally.”

“The CBPP establishes five goals:

- Expand, improve, and maintain facilities for bicycling and walking
- Improve safety for bicyclists and pedestrians
- Encourage more people to bicycle and walk
- Support local efforts to encourage walking and bicycling
- Plan for the needs of bicyclists and pedestrians

For each goal, the CBPP outlines policies and actions to achieve these goals. The Authority will use the goals, policies, and actions, as well as the other material in the CBPP, in its efforts to support bicycling and walking in Contra Costa. Local jurisdictions are encouraged to embrace these goals, too.”

Contra Costa County General Plan

“Bicycles are a viable mode of commuter transportation in the urban areas on either side of the Berkeley Hills and throughout Contra Costa County due to favorable topography and weather. Development of a comprehensive bikeway system within these areas would provide further incentive to commute by bike. A comprehensive bikeway system is defined as a system of bike paths, bike lanes, and bike routes interconnected and spaced closely enough to satisfy the travel needs of most cyclists. Many existing bikeways are of a recreational design combined with pedestrian trails and located off-street. These facilities should be supplemented by on-street commuter bikeways that provide direct access to commercial uses.”

Bikeway Goals

- Increase the opportunities for bicycle use in Contra Costa County for transportation as well as recreational purposes
- Develop coordinated, interjurisdictional Countywide network of bikeways that connects residential areas with major employment, commercial, educational, transit and cultural centers
- Assure adequate long-term maintenance of the bikeway system
- Improve bicycle education for both bicyclists and automobile drivers and promote bicycles as a mode of transportation, particularly for commuting
- Provide secure bicycle parking facilities at appropriate locations and improved access to transit systems
- Promote bikeway planning and coordination among cities, transit agencies and public utilities

IRON HORSE TRAIL USERS

FIGURE 53

San Ramon General Plan

“Bicycling and walking are key elements of San Ramon’s circulation system. The City has an extensive network of bikeways, sidewalks, and trails that enhance neighborhood accessibility and help to reduce reliance on the private automobile.”

Guiding Policy

“Encourage bicycling and walking as alternatives to the automobile.” (5.6 G-1)

Implementing Policies

- “Establish a network of on- and off-roadway bicycle routes to encourage their use for commute, recreational, and other trips. Improve and expand bicycle routes for commuters in San Ramon. The design of bike routes shall consider the safety of cyclists.” (5.6 I-1)
- “Develop bicycle routes that provide access to schools and parks.” (5.6 I-2)
- “Emphasize the Iron Horse Trail as a major northsouth route for non-motorized transportation. The Iron Horse Trail is an ideal corridor for a bicycle path because it is flat and continuous through the entire San Ramon Valley, and it links residential areas with Bishop Ranch Business Park. With a proposed path and landscaping for walkers, joggers, equestrians, and bicyclists, this Southern Pacific Railroad right-of-way is one of San Ramon’s primary public assets. The East Bay Regional Park District proposes a Class I bike route along the entire rail corridor from the Alameda/Santa Clara County line north to Martinez. Any proposal for uses other than non-motorized forms of travel will require mitigation and public participation.” (5.6 I-3)
- “Develop a series of continuous walkways within Bishop Ranch Business Park, commercial districts, and residential neighborhoods so they connect to one another. Sidewalks should be creatively designed to invite safe and pleasant use by pedestrians and should be free of obstacles such as signs. Sidewalks should be protected or separated from traffic.” (5.6 I-5)

IRON HORSE TRAIL
AT BOLLINGER CANYON

FIGURE 54

PROJECT CONSIDERATIONS

- “Continue to carry out requirements to make public rights-of-way accessible to physically disabled persons.” (5.6 I-6)
- “Adopt a Bicycle Master Plan that considers sources of statewide funding for bicycle programming.” (5.6 I-7)
- “Study the feasibility of bicycle/pedestrian overcrossings on the Iron Horse Trail at Bollinger Canyon Road and Crow Canyon Road.” (5.6 I-9)
- “Ensure that roadway improvement projects do not decrease mobility or accessibility for bicyclists or pedestrians.” (5.6 I-10)

FIGURE 57

“Trails are important elements of Danville’s park system and provide significant opportunities for recreation.”

Danville General Plan

Trails

“Trails are important elements of Danville’s park system and provide significant opportunities for recreation. Hikers, bikers, and equestrians all share a need for trails, although their specific requirements may vary. Trails have two major functions. First, they provide recreational value associated with physical fitness and the enjoyment of the natural environment. Second, in some instances, they provide safe, off-street linkages between neighborhoods, parks, schools, and other public facilities.”

“The Iron Horse Trail, running along the abandoned San Ramon Southern Pacific Railroad branch line and bisecting the Town on a north-south axis, already connects a number of recreational facilities and has become the Town’s major off-street trail. The eastern part of the Town is not as well served by the trail system. This deficiency pertains to both internal trails and connections to regional open space. Planned trails in this area will be shown on the Town’s Trails Master Plan.”

Bicycle Facilities in Danville

“Current facilities are consistent with the adopted Countywide Bicycle Plan. The Town has included bicycle facilities within its adopted Trails Master Plan and has moved aggressively forward with new bicycle facilities within the past ten years. Provision of bicycle facilities has regularly been a requirement for the approval of new development within the Town. Bicycle traffic is considered in the design of all new traffic signals installed by the Town, and local transit busses are equipped with bicycle racks. The Town should continue these activities and continue to provide for improvements such as signalized crossings, bike lockers, and bike racks, in its capital improvement planning.”

Future Needs for Bicycle Circulation in Danville

“Bikeways serve a variety of functions in Danville including transportation and recreation for people of all ages. Certain bikeway routes are recreational facilities, attracting riders from throughout the Bay Area for recreational riding. Utilization of bikeways is likely to increase as Danville improves its present bikeway system and as the community grows.”

TRAIL USERS AT SYCAMORE SIGNAL

FIGURE 58

PROJECT CONSIDERATIONS

BICYCLISTS CROSSING
SYCAMORE VALLEY ROAD

FIGURE 59

“Utilization of bikeways is likely to increase as Danville improves its present bikeway system and as the community grows.”

Goals:

- Provide for safe and efficient travel on Town of Danville streets
- Provide convenient and efficient alternative transportation modes to the automobile
- Minimize the intrusions of through traffic on residential streets
- Integrate land use and transportation planning to increase the viability of alternative transportation modes and minimize vehicle trips
- Actively participate in regional transportation planning, consistent with overall goals of Danville residents and businesses

Policies:

- Create and maintain a safe, effective system of bikeways and roadways suitable for bicycle use, including an integrated network of off-road bicycle trails and bicycle lanes along collector arterial streets.
- Assure the provision of adequate bicycle support facilities at all major bicycle usage locations
- Encourage ridesharing, car and vanpooling, park-and-ride and other alternative modes to the single-occupant automobile
- Provide a pleasant and safe environment for pedestrian movement
- Promote bicycle and pedestrian oriented mixed use development in appropriate locations, including residential, commercial, and employment activities that are easily accessible by foot, bicycle or transit
- Require design measures as appropriate to accommodate access by pedestrians, bicycles and transit within new development, and to provide connections to adjacent development

PROJECT CONSIDERATIONS

East Bay Regional Park District Master Plan

“The District provides over 1,000 miles of trails, including regional trails that connect parklands and provide access to local communities. Some trails are for hiking only or hiking and equestrian use, while others accommodate multiple uses, like hiking and biking. The District also provides special trail development, such as boardwalks. In recent years, the demand for trails close to home has increased dramatically, and trail use has been on the rise for everything from basic transportation to healthful outdoor exercise.”

“The District will expand its comprehensive trail system by providing more hiking and equestrian narrow trails and more multiple-use paved and unpaved trails. A primary objective will be to provide inter-connecting trails and to link the regional parks through a District-wide system of trails.”

Paved Multi-use Trails.

“The District currently provides over 130 miles of paved trails. These trails, primarily located in more developed areas, serve as a non-motorized circulation and transportation system connecting to public transportation hubs, employment and retail centers, and other destinations. Generally, the District’s West Metropolitan Sector and South Metropolitan Sector have a greater unmet need for paved, multi-use trails. The District will continue to plan for and expand the system of paved, multi-use regional trails connecting parklands and major population centers.”

FIGURE 61

JOGGERS AT SYCAMORE
VALLEY ROAD

FIGURE 62

Transportation Planning Land Use (T-PLUS) Grant Program

“The key objective of this program is to support local jurisdictions’ efforts to make land use decisions that will result in increased transit ridership by 1) encouraging higher density development around transit stations, and 2) ensuring that new transit villages are livable and vibrant places with appropriate transportation investments. It is envisioned that this planning program will generate conceptual development plans that will lead to feasible Transit Oriented Development (TOD) projects and identification of complementary transportation capital projects that could compete for TLC funding at the local, countywide and regional level.”

Eligible Activities

“Project activities eligible for funding include development of PDA’s, creating TOD specific plans around transit centers, designing transit area improvements that promote increased transit ridership, preparing station area revitalization plans, developing transportation and land use plans along a transit corridor, or preparing concept plans, drawings, and final design plans for TOD capital projects in close proximity to transit centers.”

CASE STUDIES

Pedestrian overcrossings are being implemented throughout the region and their benefits are becoming more broadly known. Case Studies provide an important means of evaluating the project in the context of similar projects. Included are some different pedestrian overcrossings that were constructed or designed that provide a sense of the different ways projects were started and implemented.

MARY AVENUE BICYCLE FOOT BRIDGE

Cupertino, CA

This pedestrian overcrossing crosses I-280 between Homestead Road and Meteor Drive on Mary Avenue in Cupertino and provides a safe and user-friendly route over I-280 for residents and students to and from the cities of Cupertino and Sunnyvale.

The funding for this project came from the VTA (Valley Transportation Authority) and the Santa Clara County Bicycle Expenditure Program, as well as the Bicycle Transportation Account, the City of Cupertino and the City of Sunnyvale. Some support and funding also came from Caltrans. This project was instigated and managed by the City of Cupertino.

The ground breaking ceremony for this overcrossing was on January 24, 2008. The official start date of construction was February 1, 2008, with construction completed in the second quarter of 2009.

MARY AVENUE BICYCLE FOOT BRIDGE -
CONCEPTUAL RENDERING

FIGURE 63

IRON HORSE TRAIL OVERCROSSING AT YGNACIO VALLEY ROAD

Walnut Creek, CA

On May 16, 1998, Walnut Creek and East Bay Regional Park District officials dedicated the Iron Horse Trail Overcrossing at Ygnacio Valley Road. The \$2 - 3 million pedestrian and cyclist bridge was financed with federal, state, City, and park district funds. An estimated 1 million persons are expected to use the overcrossing annually.

The driving force for this pedestrian overcrossing was the City of Walnut Creek. They received a federal grant and the project was funded with that money as well as Measure C funds. The intersection near the crossing was very busy with many pedestrians and bicyclists continually crossing the busy road to access the Iron Horse Trail. The City wanted to eliminate the crosswalk to improve vehicle traffic flow and increase pedestrian accessibility. There was no feasibility study completed for this project, so information from the East Bay Regional Park District was used to gather usage data.

The overcrossing was bid in 1997 and built a few years later. Today the City of Walnut Creek maintains this overcrossing and it remains an important link for the Iron Horse Trail users, allowing them more accessibility and greater connection to their city.

OVERCROSSING AT YGNACIO VALLEY ROAD

FIGURE 64

TREAT BOULEVARD
OVERCROSSING -
CONCEPTUAL RENDERING

FIGURE 65

TREAT BOULEVARD OVERCROSSING

Pleasant Hill, CA

Pedestrians and bicyclists will soon be able to use the proposed Treat Boulevard overcrossing. The bridge will be within the Iron Horse Trail Corridor and will increase pedestrian and bicyclist safety for those going to and from the Pleasant Hill BART station. Through community input and surveys the design for the bridge was chosen. This bridge will be important for increasing accessibility and safety along the Iron Horse Trail.

An overcrossing at Treat Boulevard has been a feature of the Contra Costa County General Plan since 1983. The plan originally proposed an overcrossing a block west at Treat and Oak Boulevards since it was thought that the primary pedestrian flow would be from BART at Oak and Treat Boulevards. It was assumed that the overcrossing was going to take off from an elevated portion of the BART Station. There was no specific traffic or feasibility study done specifically for this overcrossing, but in the Contra Costa County specific plan there were general traffic studies conducted at the intersection.

Constituency emerged for the overcrossing to be connected to the Iron Horse Trail due to input from pedestrians and bicyclists of the trail. This desire from the pedestrians and bicyclists was the main driving force for the development of the Treat Overcrossing. Some of the neighboring residents were concerned about the implementation of an overcrossing, however, gathering their input and listening to their design ideas and concerns proved to be helpful in gaining support and momentum for the project. An online survey was used where 900 people voted on the design of the bridge.

After a plan was adopted, various designs were presented to the public through community workshops. There, they were able to provide input on the bridge's design and project considerations.

The funding for this project came from multiple sources, including Measure C funds, Transportation for Livable Communities (TLC) funds, and Housing Incentive Funds (HIF).

This overcrossing is anticipated to be completed in the spring 2009.

SOUTH BAYFRONT PEDESTRIAN AND BICYCLE BRIDGE - CONCEPTUAL RENDERING

FIGURE 66

SOUTH BAYFRONT PEDESTRIAN AND BICYCLE BRIDGE

Emeryville, CA

This pedestrian overcrossing will connect to the Emeryville Greenway Trail, and ultimately the Bay Trail. This project was part of the City's General plan and did not have a feasibility study developed. The South Bayfront Bridge originally was started 4-5 years ago, and is currently in its final design and approval stages.

This project was led and completely funded by the City of Emeryville. The City's own funding has led to the quick design and implementation of this project.

A preliminary design was completed in the summer of 2008, and during meetings in the fall, comments concerning details were gathered from: the community, the South Bayfront Pedestrian-Bicycle Bridge Committee, the Bicycle-Pedestrian Sub-committee, the Planning Commission and the Redevelopment Agency. The project's design is anticipated to be complete and out for public bids by spring 2010, with construction completion in 2011.

JOHN HERNANDEZ BRIDGE

Half Moon Bay, CA

This pedestrian overcrossing in Half Moon Bay crosses Pilarcitos Creek and is an essential for facilitating pedestrian, bicycle and equestrian accessibility over the Pilarcitos creek. This overcrossing was developed as a part of the California Coastal Trail Program. This overcrossing was initiated by the City of Half Moon Bay, with this overcrossing project as Phase 2 of their Master Plan. The Coastal Conservancy approved and funded this overcrossing.

Many different agencies were involved in this project, such as the State Park and Recreation Department, The Department of Fish and Game (CFG), as well as various coastal departments and agencies. This project had to be carefully coordinated and have smooth interagency coordination for its success. Engineering challenges were faced when dealing with sandy soils and an area rich in wildlife. Working carefully to manage sewage and utility lines was necessary.

Today the John Hernandez Bridge serves an important role in its community, by increasing pedestrian accessibility, as well as preserving the wetland and creek nature and wildlife.

JOHN HERNANDEZ BRIDGE

FIGURE 67

BERKELEY I-80
PEDESTRIAN OVERCROSSING

FIGURE 68

BERKELEY I-80 PEDESTRIAN OVERCROSSING

Berkeley, CA

The Berkeley I-80 Pedestrian Overcrossing is an important addition to the Bay Area, allowing for accessibility and transportation between Berkeley and its Marina/waterfront park region. The overcrossing is 300 feet long, with a 5-foot raised pedestrian lane and two 8-foot bicycle/wheelchair lanes. The bridge is fully ADA compliant, and the ramps feature a 5% grade making it the longest unsupported pedestrian bridge in California. This bridge was opened on February 27, 2002. It costs approximately \$6.4 million to build, exclusive of design and permitting costs.

The Berkeley I-80 Pedestrian Overcrossing provides ADA-compliant access between the City of Berkeley and the Eastshore Regional Park (Berkeley Marina) to pedestrians, bicyclists, and wheelchairs. Its 90 meter clear span across one of the most congested freeways in North America provides an architectural landmark for the City and allows for the planned future reconfiguration of the freeway without modifications to the bridge.

The arch bridge across the freeway has a span of 90 meters, with a post-tensioned lightweight concrete edge girder deck, and steel arch ribs consisting of curved inclined steel tubes in a basket handle configuration. The approach spans are curved post-tensioned concrete box girders to provide wide radius turns for aesthetic and bicycle safety. The bridge was designed to meet strict seismic criteria for a near-field M7.1 earthquake on the Hayward fault, about 3 km from the site.

Today, this pedestrian overcrossing is an important addition because it provides links to the neighboring communities and creates a visual statement in its environment.

MOFFETT BOULEVARD
OVERCROSSING -
CONCEPTUAL RENDERING

FIGURE 69

STEVENS CREEK TRAIL/MOFFETT BOULEVARD OVERCROSSING

Mountain View, CA

This pedestrian overcrossing project is a pedestrian and bicycle overcrossing over Moffett Boulevard and the north-bound off-ramp for State Highway 85 to provide a grade separation for the existing Stevens Creek Trail. The overcrossing is a prefabricated steel truss structure, 3.05 meters wide and 146 meters long.

An at-grade crossing currently exists along the Stevens Creek Trail at Moffett Boulevard. This proposed pedestrian overcrossing provides an alternative to the at-grade crossing, reducing potential conflicts between cyclists and motor vehicles. The existing at-grade crossing will remain to provide pedestrians and cyclists on Moffett Boulevard convenient access to Stevens Creek Trail.

This overcrossing is an important addition to the Stevens Creek Trail, and will enhance connectivity between different entities. This project went out to bid in April, 2008, and was constructed in 2009.

TRAIL CROSSING CONCEPTS

COMMON REQUIREMENTS

Design Parameters for the overcrossings at Sycamore Valley, Crow Canyon and Bollinger Canyon Roads were taken from different sources. One of the most broadly adopted sources of design criteria is provided by the State of California Department of Transportation (Caltrans). Adherence to Caltrans criteria is a requirement for projects within Caltrans right of way and where adopted by the local municipality. The Caltrans criteria provide a set of time tested requirements. As Caltrans is responsible for the implementation of safe, maintainable structures the criteria applied to structures includes conservative assumptions. This feasibility study assumes partial, but not wholesale adoption of Caltrans standards. For the following bridge concepts, these design parameters were used:

Vertical Clearance

The minimum vertical clearance to the underside of a bridge is 17' per Caltrans' requirements for pedestrian overcrossings over the traveled way of state roadways. For purposes of the concepts presented in this report a 17'-0" clearance at each intersection is assumed.

Tread Width

A tread width of 10 feet is proposed for the Crow Canyon and Sycamore Valley Road POC's. A tread width of 12 feet is proposed for the Bollinger Canyon Road POC. Tread widths are based on minimums recommended for the anticipated traffic volumes. Wider treads are not proposed due to cost impacts and the difficulty associated with accommodating a wider bridge within the corridors where significant existing and proposed uses must also be accommodated.

Guardrails

All crossings are proposed to include guardrails in compliance with Title 24; a minimum of 54" tall with no openings large enough to allow a 6" sphere to pass through.

Approaches

Approaches will have a continuous slope of 5% and are therefore not ramps (as defined by Title 24). Although providing these minimum slopes results in longer approach ramps, the elimination of intermittent level pads and continuous handrails that would be required of steeper approaches will make the bridges much easier to negotiate for bicyclists.

TRAIL CROSSING CONCEPTS

Screening

Caltrans requires a screen fencing with a minimum height of 8'-4" along the sides of a pedestrian overcrossing. Screening in conformance with Caltrans requirements is not proposed and will require further evaluation. Advantages of the screening are an additional measure of safety as persons on the bridge will be less able to climb over the fencing than a guardrail alone. Screening also tends to discourage throwing or tossing of objects from the bridge onto the roadbed below. Conversely, screening tends to significantly change the character of the bridge and the experience of persons travelling across the bridge. Views are obscured and a sense of openness is lost. Additionally, screening will increase the visual impact of the bridge from the roads below, tending to increase the perception of mass.

Embankments

Approach ramps can be built according to three basic designs including:

- Earthen mounds with sloping sides
- Earthen mounds with vertical, mechanically stabilized earth (MSE) sides
- Spans (approach bridges)

Earthen mounds with sloping sides are not considered practical because of the narrowness of the corridor and the presence of existing and future uses.

Earthen mounds with MSE sides are proposed to allow the construction of approaches on grade (compacted earth) up to an elevation of approximately 7 feet. With a conservative design parameter of the width of the supported area equal to not more than ½ the height, 7 feet approximates a 14 foot 'footprint' which is assumed to be achievable within the constraints of the corridors. Intermediate, smaller spans are proposed to connect the roadway spans with the approach ramps.

Lighting

Bridge surfaces will be illuminated to IES standards to permit safe passage during all hours that the trail is in use. Additionally, it is anticipated that the bridges will be up-lit for aesthetic purposes to enhance their appearance at night and discourage inappropriate activity.

TRAIL CROSSING CONCEPTS

Maintenance

The bridges will be wide enough to accommodate a light maintenance vehicle and are not proposed to accommodate larger vehicles. Where vehicular access to both ends of a bridge can be reasonably achieved without using the bridge, it is generally better to have a design to accommodate the needs of pedestrians and bicyclists only. Designing to accommodate larger vehicles tends to increase costs and can necessitate changes to the trail and bridge geometry (widths, turning radii, etc.) The bridges will be designed to minimize the maintenance.

Bridge Design Alternatives

Overcrossings at all three locations should be responsive to their existing site context. At Bollinger Canyon Road, the site is anticipated to change dramatically due to the City Center development. Consideration of this change should be accounted for when developing an overcrossing concept.

Bridge Alignments

Refer to the drawing 'Alignment Plan', for overall illustrations of the bridge layouts in relation to the trail.

Attention: Colleen Salvesson

Subject: Iron Horse Trail Pedestrian Overcrossings

Dear Colleen,

Biggs Cardosa Associates, Inc. has reviewed the bridge alternatives dated February 27, 2008 for the Iron Horse Trail crossings of Sycamore Valley Road, Crow Canyon Road and Bollinger Canyon Road and attended a meeting with the City to discuss the alternatives. The alternatives are summarized as:

Bowstring Truss POC

- Main Span: 12' wide x 150' span, prefabricated steel bowstring through truss with concrete deck
- Approach Bridges: Two 12' wide x 100' span, prefabricated steel bowstring through truss with concrete deck in addition to multiple shorter steel beam spans with concrete deck or short span pre-cast or cast-in-place concrete slab bridges
- Approach fill: Approach fill with slopes or concrete walls with fill supporting a concrete ramp

Box Truss POC

- Main Span: 12' wide x 130' span, constant depth prefabricated steel through truss with concrete deck
- Approach Bridges: Multiple shorter steel beam spans with concrete deck or short span pre-cast or cast-in-place concrete slab bridges
- Approach fill: Approach fill with slopes or concrete walls with fill supporting a concrete ramp

Arch POC

- Main Span: 12' wide x 140' span, steel arch bridge with suspended pre-cast or cast-in-place concrete deck
- Approaches: Four 12' wide x 140' spans, steel arch bridges with suspended pre-cast or cast-in-place concrete deck

TRAIL CROSSING CONCEPTS

May 22, 2008
Page 2

- Approach fill: Approach fill with slopes or concrete walls with fill supporting a concrete ramp

The main spans in a Bowstring POC and a Box Truss POC are pre-fabricated steel through trusses. A through truss consists of two parallel trusses connected at the floor level and overhead with crossbeams. Overhead crossbeams are typically used as a cost effective means to provide lateral stability to the top chord of long span trusses. Approach steel truss spans are shorter and therefore may not require overhead crossbeams.

The main truss span would be shipped to the site in two or three sections and unloaded in an open area near the abutments. After splicing of the sections, the full truss is lifted into place using one or two large cranes. A night closure of traffic lanes would be the most practical approach to truss erection. The number of cranes required depends on the truss unloading location and the available lanes for crane placement.

The main span and the approach spans for an Arch POC will be custom designed and fabricated steel arches with suspended deck made of pre-cast or cast-in-place concrete deck on steel beams. Arches can be shipped to the site in one or two pieces and lifted into place. Once the arches are in place the deck structure can be erected into place and suspended from the arches. Pre-cast concrete deck pieces will then be installed or concrete deck can be poured in place over metal decking. Falsework will not be required.

Abutments, piers and concrete walls (if required) are expected to be pile supported in accordance with the geotechnical recommendations. It may be possible to transition to spread footing foundations for the shorter walls at the lower ends of ramps if differential deflections between the foundation types can be reasonably controlled by isolation joints.

If concrete walls are used for the approach ramps, the area between opposing concrete walls would be backfilled near the beginning of the ramps and transition to a box type ramp foundation at the upper end of the ramps to avoid costly paired retaining walls besides the ramp.

The structural systems outlined in the three POC's are cost effective and constructible with minimal traffic impact.

Sincerely,

BIGGS CARDOSA
ASSOCIATES, INC.

TRAIL CROSSING CONCEPTS

DOWNTOWN DANVILLE

FIGURE 70

Sycamore Valley Road Crossing

At this crossing the most appropriate bridge location is the eastern portion of the corridor, as show in Alternative A, on page 21. With this alignment there is no apparent conflict with the existing easements and the bridge is located further from homes.

The character of the bridge for the Sycamore Valley Road should fit in with the Town of Danville, which has brick and roofed elements throughout the Town. One option would be to design the bridge borrowing from local elements, such as reddish weathered steel. The clearance for this bridge is 17', with a span of 150', ramps at a 5% grade, and overall length of 950'.

SYCAMORE VALLEY ROAD - PROPOSED BRIDGE AREA

FIGURE 71

SYCAMORE VALLEY ROAD AND IRON HORSE CORRIDOR

FIGURE 72

TRAIL CROSSING CONCEPTS

Crow Canyon Road Crossing

At this location, the bridge is located along the western edge of the 50' corridor. The intent is that the bridge not interfere with the transit/light rail corridor and fuel easement. This location would necessitate very little trail realignment where the bridge meets grade. Because it would no longer be necessary, the existing signal pole for the on grade crossing would be removed. As a result the traffic flow on Crow Canyon Road will be substantially improved.

The bridge at Crow Canyon Road should be designed to fit in with the surrounding businesses, as well as the homes near by. A bridge with cement plaster abutments and a Bouquet Canyon stone fascia would be an appropriate option for this location. The clearance for this bridge would be 17', with a span of 130', ramps at a 5% grade and an overall length of about 930'.

IRON HORSE TRAIL AT CROW CANYON

FIGURE 73

CROW CANYON ROAD - PROPOSED BRIDGE LOCATION

FIGURE 74

TRAIL CROSSING CONCEPTS

IRON HORSE TRAIL
CITY CENTER
LOCATION ON LEFT

FIGURE 75

Bollinger Canyon Road

This bridge location is centered on the trail corridor at the Bollinger Crossing. The bridge would be aligned between the transit/light rail corridor on the east and a storm drain easement to the west. The trail on the north end of the bridge will require minor realignment to meet up with the bridge ramp.

This bridge is anticipated to be custom designed and fabricated, in keeping with the significance and magnitude of the City Center improvements. This bridge should compliment the architecture and appearance of the City Center as manifested in the conceptual plans for this facility. The clearance for this bridge would be 17', similar to the others, with a span of 155', ramps at a 5%, and an overall length of about 955'.

COSTS

The attached estimate of probable construction costs is based on the conceptual plans and previous experiences in the construction of similar bridge structures. The reader is cautioned that these costs are approximate only and subject to revision based on further design refinement, variations in the economic climate and additions or reductions in the scope of improvements anticipated. The estimates are based on a set of assumptions including minimal conflicts with utilities and other unforeseen conditions. In the event that more conflicts are discovered during either design or construction, the cost of implementation of the crossings will increase proportionately. Because construction is not anticipated for 3 to 4 years it is anticipated that the actual projects costs may be higher due to inflation, changes in design, changes in regulatory requirements, and other factors.

APPROXIMATE PROJECT COSTS

Bowstring Truss Design

- Site Improvements.....\$293,000
- Bridge Construction.....\$4,694,000
- Design, Permitting, Administration..... \$2,047,000

Total Project Cost..... \$7,034,000

Box Truss Design

- Site Improvements..... \$270,000
- Bridge Construction..... \$3,822,000
- Design, Permitting, Administration..... \$1,679,000

Total Project Cost..... \$5,771,000

Arch Design

- Site Construction.....\$333,000
- Bridge Construction..... \$6,144,000
- Design, Permitting, Administration..... \$2,587,000

Total Project Cost..... \$9,064,000

PROJECT PERMITTING

Environmental Clearance

California State Law requires that all projects requiring a public hearing undergo an environmental review, in compliance with the California Environmental Quality Act. For purposes of this report policy requirements have been identified to the degree that the project is sufficiently defined for this purpose.

License Agreement

The City of San Ramon or the Town of Danville will need to obtain a license agreement with Contra Costa County for the development of any bridges in the Iron Horse Corridor.

Right of Entry Permit

A Right of Entry Permit is required by Contra Costa County.

Access Permit

The City or Town will need an Access Permit with East Bay Regional Parks District. In this agreement, it will be decided who will maintain what area and which authorities will take leadership.

Maintenance Agreement

The overcrossings will require maintenance. An agreement will need to be entered into by parties responsible for maintenance.

FUNDING

There are multiple types of funding that are obtainable listed in the chart below. This shows some of the grants/funding that could be available for a project of this type.

T-PLUS funding from MTC through the Contra Costa Transportation Authority is available for programs that encourage higher density development around transit stations.

IMPLEMENTATION

Grant Source	Typical Award (max)	Contact Info	Purpose
Recreational Trails Program (RTP)	\$300,000 (\$4,680,000 for CA for next 3 yrs)	California State Parks Office of Grants & Local Services PO Box 942896, Sacramento CA 94296 Steve Radosevich / 916-651-8579	Construction, maintenance, restoration, purchase and lease of lands. Funds go towards diverse recreational trail use, motorized recreation and non-motorized recreation.
Regional Bicycle & Pedestrian Program	\$300,000 min.	Steve Heminger (MTC) 101 8th St. Oakland, CA 94607 510-464-7700	Funding available for pedestrian and bicycle facilities that provide access to regional transit, activity centers, and schools.
Transportation for Livable Communities (TLC)	\$1,000,000	Metropolitan Transportation Commission Evelyn Baker / 510-817-5753 ebaker@mtc.ca.gov	For projects developed through an inclusive community planning effort, provide for a range of transportation choices, and support connectivity between transportation investments and land uses.
Bicycle Transportation Account (BTA)	\$300,000	California Department of Transportation Bicycle Facilities Unit 154, MS-1 Division of Local Assistance PO Box 942874, Sacramento, CA 94274 David Priebe / 916-653-0036	Improve safety and convenience for bicycle commuters. Requires approved Bicycle Transportation Plan.
TDA Article 3 Funds	\$600,000	Bob Bates (TDA Program Manager) 510-817-5733, bbates@mtc.ca.gov	Provides funding for pedestrian and bicycle projects in California.
Safe Routes to Schools (SRTS) (Federal Funding)	unknown	http://www.dot.ca.gov/hq/LocalPrograms/saferoutes/saferoutes.htm	Funds projects that encourage and facilitate walking/bicycling to school, and improve children's safety.
Safe Routes to Schools (SR2S) (State Funding)	\$900,000 max.	Joyce Parks 916-653-6920 joyce_parks@dot.ca.gov	The SR2S program funds projects that improve the safety of pedestrian and bicycle routes to/from schools.
Caltrans Community Based Planning	\$300,000 max	Susan Youngs, Southern California Association of Governments/ 818 W. 7th St. Flr 12. Los Angeles, CA 90017/ (213) 236-1833	Caltrans provides funding coordinated with transportation and landuse planning that promotes public engagement, livable communities and a sustainable transportation system (mobility, access and safety)

NEXT STEPS

This report is the first step in the process of implementing pedestrian overcrossings at the various intersections. There are a number of steps that will be necessary for continuing this project and moving it forward. These steps include:

- Secure additional funding
- Prioritization of crossings - determining which crossing should be pursued first
- Development of refined plans
- Preparation of environmental documentation (CEQA)
- Preparation of preliminary and final design drawings
- Construction

FUTURE PROJECT PHASES

FIGURE 78

CONCEPT PLAN PRESENTATIONS

This concept plan was presented at the following meetings listed below:

- Danville Town Council 5/20/2008
- San Ramon City Council 6/10/2008
- San Ramon Transportation Advisory Committee 6/19/2008
- San Ramon Planning Commission 7/01/2008
- San Ramon Chamber of Commerce Board of Directors 9/09/2008
- San Ramon Park Commission 9/24/2008
- Contra Costa Iron Horse Trail Advisory Committee 11/17/2008

Location of Meeting: San Ramon City Hall

Date of Meeting: August 27, 2007

Page 2 of 5

Item

Person and date to follow up

Project Background and Goals

- The project is federally funded by Transportation Planning Land Use (T-PLUS) grant money totaling \$100,000 and administered by the Contra Costa Transportation Authority (CCTA). The City of San Ramon and Town of Danville will front the cost of and be reimbursed through CCTA.
- Pedestrian/bicycle crossings at these locations (Bollinger Canyon, Crow Canyon) have long been discussed within the City of San Ramon and other agencies, but no plan has ever been previously developed.
- The goal is to present a completed Corridor Concept Plan to the Councils of both San Ramon and Danville by the prior to the end of August 2008.

CA to provide a project schedule to all meeting attendees (attached).

Project Administration

- The City of San Ramon will serve as the project lead for all involved public agencies. LB will act as the project manager and primary contact.
- CA will serve as the primary contact for the consulting team. However, FP will work directly with LB to acquire the necessary data for the upcoming traffic studies.
- Project documents should be formatted on project specific letterhead containing the project name and logos of the involved agencies.
- There should be a single contact number set up for all public inquiries regarding the project.
- Invoices must be formatted as required for federal funding. Ideally, a single invoice format may be developed that meets the needs of the CCTA, the City of San Ramon, and the Town of Danville.

FP to contact LB to request data by 9/7.

LB to provide CA with example by 8/31. CA to call LB to discuss.

LB to set up if feasible and provide number to CA.

BB to provide LB with an sample invoice format by 9/7. CA to develop a proposed invoice format to be circulated for comment.

Stakeholders

- Following is a list of stakeholders identified at the Kick-off Meeting:
 - East Bay Bicycle Coalition (EBBC) - Umbrella group for several local bicycle groups. LB to provide CA with EBBC contact and contacts for the local groups by 9/7.
 - Various corporate bike groups (AT&T, Chevron, etc.) LB to provide CA with list by 9/7.
 - The neighborhoods just east of the Iron Horse Trail at the Sycamore Valley crossing in Danville are likely to be involved, particularly the neighbors along Everett Place. These communities are not represented by HOAs. TW to provide mailing list for these neighborhoods.
 - HOA groups in San Ramon, specifically Vista San Ramon and Canyon Lakes. LB to provide CA with contacts by 9/7.
 - Various schools along the trail. School District facilities and community relations staff as well as representatives from each nearby school should be invited to join the process. LB to provide CA with contacts by 9/7.
 - City of San Ramon and Town of Danville Chambers of Commerce LB/TW to provide CA with contacts by 9/7.
 - BART
 - Iron Horse Advisory Committee - comprised of local residents and business community members who assist the County in improving and managing the corridor and trail. JP to provide member contact information to CA by 9/7.
 - East Bay Area Trails Council (EBATC) JT to provide contact info to CA if available by 9/7.
 - Parks Advisory Committee - includes both the Mayor of Danville and a Council member from San Ramon. LB to provide committee contact to CA by 9/7.
- The local police departments do not monitor the trail; it is patrolled by the EBRPD.
- The trail is a regional facility, so only notifying neighbors is likely to bring out a larger number of people who could oppose trail improvements while omitting the bulk of those who would be served by them.

Meeting Summary

Kick-Off Meeting

RE: IRON HORSE PEDESTRIAN AND BIKE CORRIDOR CONCEPT PLAN

Location of Meeting: San Ramon City Hall

Date of Meeting: August 27, 2007

Page 4 of 5

Item

Person and date to follow up

- Stakeholder meetings are to be held in October. Stakeholders should be notified of meetings by the City and Town through various means including post card mailers, town newsletters, local papers, City websites, and signs posted on the trail at the three crossing locations. LB to provide CA with list of any additional stakeholders not mentioned above by 9/14. CA to prepare postcard mailer.
- Stakeholder meeting should avoid open-ended approach, asking specific questions and emphasizing that this is the first stage of a long range planning effort and development process before these crossings can possibly be constructed. CA to create a schedule of the overall process showing implementation occurring many years in the future for use at stakeholder meetings.
- The next PDT meeting will be held following the stakeholder meetings and is tentatively scheduled for October 29 at 3:00 in the Council Chambers at San Ramon City Hall. All PDT members to attend.

Agency Concerns

- The County is the property owner and is concerned with respecting the interests of the various utility easements that utilize the Iron Horse Corridor. JP to provide Record of Survey drawings showing all utilities and easements to CA by 9/7.
- The County purchased the Iron Horse Corridor with grant money intended for the development of a rail system. If the County ever develops the site in such a way as to prevent its future use for rail transport, they must refund the grant money. There is currently a 30-foot wide easement reserved for future rail use that is delineated on the Record of Survey. Concept Plan to avoid encroachments into the 30' easement.
- Many members of the communities surrounding the Iron Horse Corridor oppose its use for any motorized transit. It was originally identified as a BART line in the Regional Rail Plan. Concept Plan to focus on pedestrian and bicycle use and not to address the issue of rail use. JP to provide CA with a copy of the Regional Rail Plan by 9/7.
- EBRPD is responsible only for a 20' strip of the corridor in which the trail is located. Their primary interest is in improving safety at the major crossing locations.
- Trail and bridges should meet ADA standards for accessibility.
- Question of who will maintain the bridge structures once they are built has not been answered.

Meeting Summary

Kick-Off Meeting

RE: IRON HORSE PEDESTRIAN AND BIKE CORRIDOR CONCEPT PLAN

Location of Meeting: San Ramon City Hall

Page 5 of 5

Item

Person and date to follow up

-
- If cost of individual pedestrian bridges exceeds \$3-3.5 million, the project will likely encounter a higher level of resistance.
 - This project should be integrated with the design of the San Ramon City Center planned just west of the trail at Bollinger Canyon.
LB to provide CA with City Center plans by 9/7.
 - Traffic studies should account for anticipated use from sites currently being developed along the trail.
LB/TW to provide CA with locations and available plans for any sites currently in planning or construction efforts along the trail, including the commercial development at Sycamore Valley.
 - At this time, the crossings should not be prioritized and no phasing should be recommended as part of the Corridor Concept Plan.
 - Peak weekend use is 8:30-12:00 on Saturdays.
FP to work with LB to identify key areas for weekend use observations to be conducted during this time period.

The information above is Callander Associates' understanding of items discussed and decisions reached at the meeting. Callander Associates is proceeding with the project based on this understanding. If you have any questions, additions, or corrections to this memo, please contact this office in writing within three days.

The purpose of this meeting was to inform attendees about the current project to study three overcrossing locations on the Iron Horse Trail, discuss project developments, and gather input including suggestions, endorsements, and concerns for the project.

The following information was discussed and/or decided upon in our meeting:

Attendee question / comment

Response if provided

- | | |
|---|--|
| <ul style="list-style-type: none"> • Have the crossings been prioritized? The Bollinger Canyon crossing may serve the greatest need. | <p>At this time, no priority has been assigned to any of the three crossings.</p> |
| <ul style="list-style-type: none"> • The need for a crossing at Bollinger Canyon is driven not by the proposed San Ramon City Center, but by currently existing uses. The City Center will only add to the current demand. | |
| <ul style="list-style-type: none"> • Traffic volume should be a consideration in prioritizing the crossing locations. This should include both vehicle volume and bicycle and pedestrian counts. | <p>This Study will include an assessment of vehicle, bicycle, and pedestrian traffic volumes at each location, which can be used to prioritize the crossings.</p> |
| <ul style="list-style-type: none"> • What are the current limits of the Study? | <p>This Study will examine the Iron Horse Trail between Sycamore Valley Road and Bollinger Canyon Road, with a focus on the crossings at Sycamore Valley, Crow Canyon, and Bollinger Canyon Roads.</p> |
| <ul style="list-style-type: none"> • Why not include Alcosta Blvd. in the study, either looking at a potential crossing at this location or including vehicle and pedestrian counts for comparative purposes? | <p>Prior to project initiation the CCTA and others identified B, CC and S as the three highest priority crossings for immediate study. Study of additional locations could be part of a future effort.</p> |
| <ul style="list-style-type: none"> • How is the project funded? Has any funding been identified for implementation of the overcrossings if recommended by this Study? | <p>The current project is funded by a Federal T-Plus grant administered by the Contra Costa Transportation Authority. Potential funding sources for implementation include Measure J, which includes funding for pedestrian and bicycle crossings and will become available in 2009, as well as Transportation for Livable Communities (TLC), Metropolitan Transportation Commission (MTC), and additional Federal T-Plus funds.</p> |
| <ul style="list-style-type: none"> • Can the schedule for the study be accelerated? A completed plan could assist the City in planning for the City Center and Citywide park facilities. | <p>If consensus is gained more quickly than anticipated in the current schedule, some acceleration may be possible.</p> |

Meeting Summary – Community Input

Page 3 of 4

Location of Meeting: San Ramon Community Center

Date of Meeting: October 16, 2007

*Attendee question / comment**Response if provided*

- The City is willing to take necessary steps to accelerate the schedule.
- What role does the existing 34-foot wide transit easement play in the planning for the site?

This easement was established by Contra Costa County to provide an easement for potential future light rail in the corridor. The County will likely not allow permanent facilities, including an overcrossing or trail, within the transit corridor.
- Light rail use in the corridor is not advocated by the City of San Ramon or the Town of Danville. Can the study recommend the elimination of the transit easement in the Iron Horse Trail corridor?

This easement must be maintained by the County because the property was purchased with grant money dedicated to mass transit projects. If light rail use is eliminated, the County may be required to refund the grant money.
- Because the trail is very well used, conflicts between various types of users are common. Many bikers prefer to ride on the streets rather than riding at limited speeds on the corridor. Could a separate bicycle trail be provided along side the current trail?

The corridor is too constrained to accommodate separate dedicated trails. Constraints include easements for future light rail (34') and multiple utilities including gas transmission lines, fiber optics, and high voltage electrical transmission lines.
- Do the overcrossings need to accommodate future light rail use?

The overcrossings in this study are intended for trail use only and will not accommodate light rail.
- The EBRPD produced a study in 1997 examining use of the trail. This study concluded that the primary use was to get between schools, shops and residences.
- It would be useful to determine what percentage of people are commuting longer distances on the trail.
- There is a significant transit facility (West Dublin BART station) being constructed outside the limits of the project which will likely impact trail use.
- The EBRPD has recently constructed two similar crossings along the Iron Horse Trail. These crossings have been very well received--4,000 people showed up for the dedication of the Ignacio Valley Boulevard crossing--and are well used.

Meeting Summary – Community Input
Page 4 of 4

Location of Meeting: San Ramon Community Center
Date of Meeting: October 16, 2007

Attendee question / comment

Response if provided

- Construction of a new overcrossing allows for uninterrupted flow of both pedestrians/bicyclists and vehicles, improving efficiency and convenience for both.
- Pedestrian and Bicyclist counts should be scheduled for sunny days as many more people use the trail during favorable weather.
- Counts need to account for future use generations from City Center.
- Can at-grade crossings be eliminated if the overcrossings are constructed?
- Direct access, via stairways if necessary, should be provided from the roadway to the overcrossing without requiring users to backtrack to the beginning of the overcrossing ramp. The BART pedestrian bridge at the Coliseum provides an example of this type of access.
- Can study recommend elimination of mass transit use in trail corridor?

Counts will be scheduled.

Figures from the traffic study conducted for the City Center will be utilized in the study to account for the anticipated increase in use.

At-grade crossings would still be necessary at Sycamore Valley and Bollinger Canyon Roads because there are existing intersections at those locations. The mid-block crossing could likely be eliminated at Crow Canyon Road.

The information above is Callander Associates’ understanding of items discussed and decisions reached at the meeting. Callander Associates is proceeding with the project based on this understanding. If you have any questions, additions, or corrections to this memo, please contact this office in writing within three days.

Consultants:

Mark Slichter, Callander Associates (CA), mslichter@callanderassociates.com

Robert Deegan, Callander Associates (CA), rdeegan@callanderassociates.com

Emily Johnson, Fehr & Peers (FP), e.johnson@fehrandpeers.com

The purpose of this meeting was to update the PDT on recent project developments, review community comments, traffic counts, and project constraints, and develop a strategy for moving ahead with the Study.

The following information was discussed and/or decided upon in our meeting:

Item

Person and date to follow up

Review of Community Input Meeting (10/16/07)

- The City of San Ramon had requested that the project schedule be accelerated if possible. This will allow the project to be submitted in a draft form for additional T-Plus funds, applications for which are due in March of 2008. A revised schedule was distributed at the meeting that accelerates the project by shortening several tasks and initiating the exploration of overcrossing design alternatives while the traffic study is still underway.

For more information about this project, please call (925) 973-2598

Item

Person and date to follow up

- It had been requested that this study give some priority to the three crossing locations. However, the purpose of this study is to develop a concept for all three crossings. Priority will be assigned by the individual municipalities that govern these crossings and by the availability of funding.

Context Map

- Callander Associates presented a context map showing key use generating facilities along the study segment of the Iron Horse Trail to facilitate future discussions and meetings. Members of the PDT were asked to provide any comments on the readability and completeness of the map. All PDT members to provide full comments on the context map (attached) by 11/14.
- Major arterials and Hwy. 680 should be identified as black; trail should be changed to green. CA to revise.
- Various phases of Bishop Ranch should be separately identified. CA to add.
- Connections to on-street bike facilities should be noted. CA to add.
- FP prepared a similar, but more detailed map for use with their traffic study. The map prepared by CA is simpler and should be used for public discussions.

Traffic Data

- FP distributed results from pedestrian and bicycle counts from four locations along the trail. Counts were conducted on Tuesday, October 23 at 8-9 AM, 3-4 PM, and 4-5 PM; on Saturday October 27 at 10-11 AM; on Wednesday October 31 at 7:30-8:30 AM, 2-3 PM, and 5:30-6:30 PM; and on Saturday November 3 at 10-11 PM. A summary of the accounts is attached.
- Highest Saturday use appears to be at El Capitan Drive. This site also would likely have the highest weekday counts because of the proximity of schools.
- The Sycamore Valley Road (SVR), Crow Canyon Road (CCR) and Bollinger Canyon Road (BCR) crossings act as barriers or turn-around points. Counts at these locations could be expected to increase with the construction of overcrossings, which would effectively remove the barrier. Current counts should be considered a baseline for potential future use. FP to factor into demand forecast.

Meeting Summary - PDT Meeting #2
Page 3 of 5

Location of Meeting: San Ramon City Hall
Date of Meeting: November 6, 2007

Item

Person and date to follow up

- Some data regarding an increase in trail use due to the construction of an overcrossing may be available from the recent overcrossing constructed on the Iron Horse Trail at Ygnacio Valley Road in Walnut Creek.

FP to contact John Hall to request information by 11/21.
- Additional Data regarding cyclists during the commute and lunchtime hours may be available from Marci at Bishop Ranch as well as AT&T and Chevron. This data could include annual ridership as well as bicycle locker rental rates. Locker rentals at the San Ramon Transit Center should also be considered.

LB to provide contact info to CA for AT&T and Chevron bicycle representatives by 11/16. CA/FP to contact representatives for data by 11/21. FP to factor data into demand forecast.
- FP observed many jaywalkers at study crossings.

FP to include in assessment of corridor safety issues.
- The daily vehicle count of 53,000 on CCR west of Hwy. 680 was higher than expected. It would be interesting to compare this number to the daily count on CCR west of BCR.

FP to verify accuracy of count. LB to check City records for a recent count west of BCR.
- Trail use is currently highest on Saturday, but weekday use may grow more rapidly due to development of the San Ramon City Center and increasing use of non-motorized transit for commutes to work and school.

FP to address in demand forecast.
- Danville has recent pedestrian and bicycle counts for the Iron Horse Trail at Del Amigo Road and San Ramon has recent counts at Montevideo Drive. This data could be useful in assessing the overall use of the trail.

LB and TW to provide to FP by 11/16.
- San Ramon Central Park, Iron Horse Middle School, and California High School are all major use generators at the BCR crossing. FP observed the California High School cross-country team using the trail at this location.
- Establishment of Bicycle and Pedestrian desire lines should note origins and destinations rather than precise paths of travel. Emphases should be on new developments. "Desire Lines" may not be the most appropriate name for this portion of the study.

FP to address in traffic study.
- New developments planned along the Iron Horse Trail include the San Ramon City Center, The Rose Garden development in Danville, a new 30-40 unit Condo development north of CCR, and a new 8-10 unit detached housing development near Osage Park that will also provide a trail connection to the park.

TW to provide CA with plans for the Osage housing development by 11/16.

Project Constraints

- The corridor is heavily constrained by existing utilities and a 34-foot wide transit corridor dedicated to future light rail use.
- No alternative should be “off the table” for this feasibility study. All alternatives should be considered and the pros and cons noted for each. A final decision as to which alternatives to pursue further will be made by policy makers. Alternatives to be considered include:
 - Locating the overcrossings within the transit corridor (this could include a commitment by the City or Town to remove the overcrossings if rail is developed in the future).
 - Relocating utilities.
 - Relocating the transit corridor (if the transit corridor is relocated over utilities, this could include a commitment by the City or Town to fund the relocation of those utilities when rail is developed).
 - Locating the overcrossings outside the Iron Horse Trail corridor (if property acquisition is required, study should clearly state that this alternative would be conditioned on the City or Town acquiring the needed property prior to implementation of the project).
- The precise location and depth of the various utility lines within their easements is not known by the County or the respective utility companies.
- Information regarding the size of each of the utilities located within the corridor would indicate the cost implications of relocating the various utilities and will assist in selecting the most financially feasible alternative for locating the overcrossings.

CA to provide multiple alternatives for each overcrossing location with a clear summary of pros and cons for each alternative.

JP to provide utility size information along with updated record of survey to CA by 11/19.

Schedule

- PDT #3 will include assessment of overcrossing alternatives and a review of the preliminary Corridor Concept Plan. This meeting is currently scheduled for late January but should be accelerated if possible. Biggs Cardosa should be included in PDT#3.

CA/FP to accelerate tasks where possible to move PDT#3 up to mid-January. CA to notify Biggs Cardosa to attend PDT#3.

Meeting Summary - PDT Meeting #2
Page 5 of 5

Location of Meeting: San Ramon City Hall
Date of Meeting: November 6, 2007

Item

Person and date to follow up

- Public Workshops will not be held until the initial concepts have been presented to the San Ramon City Council and Danville Town Council.
CA to work with LB/TW to schedule these Council meetings. CA to revise schedule to reflect these meetings.

The information above is Callander Associates' understanding of items discussed and decisions reached at the meeting. Callander Associates is proceeding with the project based on this understanding. If you have any questions, additions, or corrections to this memo, please contact this office in writing within three days.

Project Development Team Meeting #3

Location: San Ramon City Hall

Date of Meeting: January 16, 2008

Page 1 of 5

Attendees: *Project Development Team (PDT):*

Lisa Bobadilla (LB), Transportation Division Manager, City of San Ramon,
lbobadilla@sanramonca.gov

Lauren Barr (LBa), City of San Ramon, lbarr@sanramon.ca.gov

Tai Williams (TW), Town of Danville, twilliams@ci.danville.ca.us

John Pulliam (JP), Contra Costa County Public Works, jpull@pw.cccounty.us

Jim Townsend (JT), East Bay Regional Park District, jtownsend@ebparks.org

Consultants:

Mark Slichter, Callander Associates (CA), mslichter@callanderassociates.com

Colleen Salveson, Callander Associates (CA), csalveson@callanderassociates.com

Emily Johnson, Fehr & Peers (EJ), e.johnson@fehrandpeers.com

The purpose of this meeting was to review and present to the PDT recent project developments, traffic counts study and bridge alignment ideas.

The following information was discussed and/or decided upon in our meeting:

Item

Person and date to follow up

Review of PDT#2 (11/6/07)

- The grant funding available is from Transportation Planning Land Use (TPLUS). The Contra Costa Transportation Authority (CCTA) has recommended TPLUS applications of \$200,000 or more. LB to get TPLUS application to CA

Context Map

- Callander Associates presented the revised context map showing key use generators along the Iron Horse Trail. Members of the PDT were asked to provide any comments on the readability and completeness of the map. All PDT members to provide full comments on the context map by 1/26

For more information about this project, please call (925) 973-2598

Meeting Summary - PDT Meeting #3
Page 2 of 5

Location of Meeting: San Ramon City Hall
Date of Meeting: January 16, 2008

*Item**Person and date to follow up*

- The “On Street Bike Lanes” should be labeled by type (Class I,II, III)
- Parts of the “On Street Bike Lanes” are incorrect.

CA to revise.

TW to give edits to CA

Project Schedule

- The project schedule has been updated – PDT#4 is scheduled for February 27 at 3:30.
- The intent is to present bridge concepts and supporting data to the city and town councils.
- Concepts and data will be provided to the City for their use in applying for TEA-Plus funding.

Traffic Data

- EJ distributed results from pedestrian and bicycle counts from four locations along the trail.
- FP will receive data shortly from CHP concerning collisions at the various crossings. There have been three reported collisions at the Crow Canyon intersection between 2002-2007.
- Long signals at the various crossings led many pedestrians to jay-walk.
- Near the Sycamore intersection, Northbound Camino Ramon has a poor driver visibility towards the Sycamore crossing.
- At Bollinger (eastbound) many cars back up into the intersection, leading pedestrians to jay-walk.
- EJ reported that there were not many children using the crossings. It was thought that most children were traveling in between the crossings and not through them.
- The Sycamore Valley Road (SVR), Crow Canyon Road (CCR) and Bollinger Canyon Road (BCR) crossings act as barriers or turn-around points. 25% of trail users turn around at the crossings. Counts at these locations could be expected to increase with the construction of overcrossings, which would effectively remove the barrier.
- The highest percent of increase in future volumes were predicted to be at Crow Canyon during peak hours. Many felt this prediction seemed high. JT also pointed out the during summer

FP to add data to study

FP to check distribution totals for Crow Canyon future volumes.

Meeting Summary - PDT Meeting #3
Page 3 of 5

Location of Meeting: San Ramon City Hall
Date of Meeting: January 16, 2008

Item

Person and date to follow up

months the entire trail will be heavily used between 7-9PM.

- It was pointed out that for vehicles traveling to the new City Center, they will likely turn before going through the IHT crossing.
- Access to adjacent land uses, such as Central Park at Bollinger Canyon Road needs to be considered when planning the various bridge crossings.
- One Level of Service (LOS) methodology should be used for all studies. CCTALOS is the recommended methodology because it is the CCTA’s approved methodology and jurisdictions located in Contra Costa County, including the SR City Center Project, have used this methodology.
- It was discussed to consider removing the at-grade crossings at Crow Canyon if a bridge is implemented. This will provide a smoother traffic flow.
- Pedestrians being re-routed and back-tracking due to new bridge overcrossings should be considered. Providing stairs to get across, such as at the Ygnacio Bridge, located in Walnut Creek is a possible solution.
- The ‘projected growth in trail use and vehicle volumes chart’ should be simplified.

FP to use CCTALOS methodology.

FP to edit chart.

Crossings/Alignments

- CA presented possible bridge alignments for the various crossings, and explained the pro’s and con’s with each layout.
- JP verified that the transit corridor is a 34’ wide placeholder that is able to be shifted around. This will provide for more flexibility when investigating different bridge alignments. It should still not be placed over easements, however if it is already shown over an easement (such as at Crow Canyon), it can encroach further.
- **Sycamore Crossing Alignment:**
 - Alternative A: JT believes it will not be a problem to cross over the transit corridor to tie the bridge back to the trail. JP doesn’t think it is ideal to place the bridge adjacent to KM line (KM gas line easement location is not precisely known) JP said a 4’ overlap with transit corridor is feasible.

JP to verify if any easements or obstructions were missed.

Item

Person and date to follow up

- Alternative B: TW pointed out that the structure would be very close to homes and could meet with community resistance; however both options should still be shown.

- **Crow Canyon Crossing Alignment:**
 - Proposed Alignment: It is preferable that the bridge links up with the trail. There are homes nearby that could object to a bridge being built because it would impact their view. TW to check the vertical clearance requirements and give information to CA.

- **Bollinger Canyon Crossing Alignment:**
 - The Alignment Alternatives Preliminary Plan shows that the bridge alignments are similar, with A being on the south side of the storm drain easement, and B being on the north side.
 - The close proximity of the crossing to homes may create a conflict for residents.
 - It is important to have an access point from the bridge to the City Center and to the adjacent park.
 - The bridge should be lined up with the trail.

- Images/Illustrations of the various bridge crossings should be created to further design concepts. CA to create illustrations/drawings of the proposed bridges.

Bridge Reference Imagery

- The image of the brick bridge with weathered steel was preferred and thought to be well suited for the Sycamore Crossing.

- The glass/steel/cable imagery was thought to be appropriate for the Bollinger Canyon Crossing. LB liked the Sun-Dial bridge appearance. It was mentioned that the council may want the bridge to relate to the overcrossing at the golf course on Bollinger, however this look is very different than the proposed City Center design. CA to look at Treat Bridge, and City of Davis Bridges.

- It was agreed that the Crow Canyon Crossing should have a stone Bokay Canyon element incorporated in its design, such as some similar images show. Everyone to give images or material ideas for all bridge crossings to CA by 2/1

- All comments related to the crossing/alignments should be forwarded to CA by February 1, 2008

The purpose of this meeting was to review and present to the PDT recent project developments, traffic counts study and bridge concept ideas.

The following information was discussed and/or decided upon in our meeting:

Item

Person and date to follow up

Review of PDT#2 (11/6/07)

- TPLUS applications are due April 30, and \$100,000 will be requested.

LB to get TPLUS application to CA.

Project Schedule

- The IHT Corridor Concept Report will be taken to San Ramon City Council on Tuesday, April 8 and Danville Town Council on Tuesday, April 15.
- Staff reports are due 10 days before going to council.

CA will give Corridor Concept Report to LB by 3/26 for review.

For more information about this project, please call (925) 973-2598

Meeting Summary - PDT Meeting #4

Page 2 of 4

Location of Meeting: San Ramon City Hall

Date of Meeting: February 27, 2008

*Item**Person and date to follow up*

- PDT #5 is scheduled for Wednesday, March 19 from 1:30-3PM in the Planning Conference Room.

Traffic Data

- FP presented minor changes in the description of traffic counts and reviewed the changes per JT comments. An updated "Corridor Concept Plan" was distributed.
- Many were concerned that the data indicated lower usage figures than the perceived level of use.
- Re-evaluating the traffic and use data could shed light on usage. More focus should be given to improving vehicle traffic and more qualitative projections should be made
- It was decided that FP data will investigate the Bollinger Canyon Road crossing using SYNCHRO methodology.
- The report should emphasize a high priority on improving pedestrian safety.
- FP explained that the history of the Ygnacio Bridge was researched, and there was no feasibility study or data gathered pertaining to the bridge development.

FP to analyze data at Bollinger using SYNCHRO.

Corridor Concept Report

- TW asked that the report should show the direct benefit to the community through the bridge development.
- LB suggested that showing annual use rather than 'peak hour' use could be beneficial for making a larger statement about the use that currently occurs along the trail.
- TW stated that the report needs to focus on one crossing (possibly Bollinger), be qualitative, provide annual data and site case studies.
- Case studies and previous pedestrian bridge overcrossings should be investigated.

CA will include planner and user info in the report.

LB will contact Contra Costa County and gather information on the Treat Overcrossing.

CA will gather information on overcrossings in San Jose.

JT will investigate the Antioch Bridge development.

Meeting Summary - PDT Meeting #4
Page 3 of 4

Location of Meeting: San Ramon City Hall
Date of Meeting: February 27, 2008

Item

Person and date to follow up

- The report should include the importance of transit oriented development for these crossings.
- There are plans to widen Bollinger to 4 lanes total, 2 on each side, as well as a Bishop Drive extension.
- With more lanes on Bollinger, signal time will increase and traffic will increase, indicating that an overcrossing will be more beneficial after the widening.

LB will investigate the Mokelumne Bridge development.

LB to give CA the Bollinger Road widening plans.

CA to revise Bollinger crossing with new roads. Bollinger bridge span will be increased.

Bridge Concepts

- CA presented possible bridge concepts for the various crossings, providing a starting point for discussion on their aesthetics and feasibility.
- **Sycamore Bridge Concept:**
 - It was thought that the brick and column appearance was good and fit well with its surroundings. LBA pointed out that having wood decking on any bridge can be a maintenance problem.
- **Crow Canyon Bridge Concept:**
 - TW thought the concept provided a good mesh between San Ramon and Danville.
- **Bollinger Bridge Concept:**
 - This bridge would be the most custom of the three.
 - JT explained that glass siding could be a maintenance issue, and is easily vandalized. Having an open mesh wire on the sides of the bridge is a possible alternative that could maintain the transparency.
 - LBA mentioned that the glass could be reflective and could impair drivers' vision.

Meeting Summary - PDT Meeting #4
Page 4 of 4

Location of Meeting: San Ramon City Hall
Date of Meeting: February 27, 2008

Item

Person and date to follow up

- It was thought that stairs at this location would be the most beneficial.
- Providing multiple designs to take to council and the public meetings was discussed.

CA to study the feasibility of including stairs at Bollinger.

LB will circulate the bridge concepts to the planning department and respond.

CA will email 'Draft Bridge Concepts' to all PDT members.

CA will provide preliminary costs at the next PDT.

All PDT members to provide comment by 3/7/08

The information above is Callander Associates' understanding of items discussed and decisions reached at the meeting. Callander Associates is proceeding with the project based on this understanding. The purpose of this meeting was to review and present to the PDT recent project developments: the SYNCHRO traffic data, and IHT Draft Corridor Concept Report.

The following information was discussed and/or decided upon in our meeting:

Item

Person and date to follow up

Review of PDT#2 (11/6/07)

- TEA PLUS applications are due April 30, and \$100,000 will be requested to proceed with preliminary engineering.

LB to compare report with application requirements

General

- Qualitative information will be necessary in the Concept Report.
- The Bollinger Widening Plans have been incorporated in the SYNCHRO data and all concept drawings in the report.

LB and FP will verify if the "Bollinger Widening Plan" is to be used, or if the "City Center Widening Plan" is to be used

For more information about this project, please call (925) 973-2598

Meeting Summary - PDT Meeting #5
Page 2 of 4

Location of Meeting: San Ramon City Hall
Date of Meeting: March 19, 2008

Item

*Person and date to follow up
for traffic data and concepts.*

Traffic Data – SYNCHRO Analysis

- FP presented traffic data using the SYNCHRO methodology.
- Peak hour figure was used at Bollinger Canyon and it was found that overcrossings would reduce vehicle delays by at least 35 seconds.
- It was mentioned that the SYNCHRO methodology could be inconsistent with the City Center traffic data methodology.
- Having a display showing the proposed Bollinger overcrossing and a survey about trail use at the crossings on “Bike to Work Day” – May 16, is an option that the City of San Ramon may pursue. “Bike to Work Day” Surveys could be conducted and if accepted, data information can be added in the appendix of the report. The data would not be able to be incorporated into the report before it goes to council or public meetings.
- Reaching out to advocates of the overcrossings could provide an indication of significant support for the overcrossings.
- FP explained that the history of the Ygnacio Bridge was researched, and there appears that there was no feasibility study or data gathered pertaining to the bridge development. The bridge came about as a result of the advocacy of individuals.

LB and FP will decide how to incorporate both methodologies, and will provide explanation for methodology choice in report.

LB to provide FP with most recent information regarding Bollinger widening

Draft Corridor Concept Report

- CA presented the draft corridor concept report, explaining the new illustrations, cost estimates and data.
- Case studies should be added to the report
- Safety should be a more prominent element of the report.
- It was decided that the Architect for the City Center should be approached about submitting a sketch for the Bollinger Bridge,

CA to add case studies to the Concept Report.

CA to elaborate on safety as a part of the Concept Report.

LB/LBa to ask Architect for a rendering of a bridge for the

MEMORANDUM

Date: April 24, 2008

To: Mark Slichter, Callander Associates

From: Emily Johnson and Ellen Poling, Fehr & Peers

Subject: *Final Iron Horse Trail Corridor Concept Plan: Summary of Data Collection, Analysis, and Usage Forecasts*

WC07-2471

Fehr & Peers was charged with determining the existing use and forecasting the future use of the Iron Horse Trail at three proposed overcrossing locations. The forecasts will help the Project Team prioritize and plan the overcrossings to accommodate the expected level of use. The proposed locations are at Sycamore Valley Road in the Town of Danville, and Crow Canyon Road and Bollinger Canyon Road in the City of San Ramon. The study corridor and proposed overcrossing locations are shown in **Figure 1**. All figures are attached at the end of this memorandum.

This memorandum presents the results of Fehr & Peers' data collection, analysis, and usage forecasts for the corridor, and incorporates comments received from the project team on the Draft Memorandum presented in January and March 2008. The memorandum is divided into the following three sections:

1. Existing Trail Use & Vehicle Volumes
2. Future Use Projections
3. Preliminary Findings

1. EXISTING TRAIL USE & VEHICLE VOLUMES

Trail use

Fehr & Peers counted trail users at the three proposed overcrossing locations on a weekday (Tuesday, October 23, 2007) during the morning (8:00-9:00 AM), mid-day (2:00-3:00 PM or 3:00-4:00 PM), and evening (4:00-5:00 PM) peak hours. We also counted trail users on a weekend (Saturday, November 3, 2007) at the three proposed overcrossing locations and one additional location (El Capitan Drive in San Ramon) during the Saturday peak hour (10:00-11:00 AM). The peak hours were selected to capture peak use from local residents, school children, and employees. The trail is also used during the lunch hour (12:00-1:00 PM), but this hour was not counted. Weather on both days was clear and sunny, and no unusual activity was noted. It is likely that trail use would be higher during the spring or summer, but the project schedule did not allow for counts during this time.

The counts included direction of travel and differentiated between pedestrians, adult bicyclists, child bicyclists, runners, and other (skateboarders, rollerbladers, etc.) We supplemented the data collected with recent counts by the Town of Danville at El Capitan Drive and Greenbrook Drive during the morning and mid-day peak hours. The trail counts are summarized in Table 1 and the combined data (counts plus City data) is shown on **Figure 2**.

**TABLE 1
 EXISTING PEAK HOUR TRAIL USE: COUNT SUMMARY**

Location	User Type					Total
	Pedestrians-Adults	Bicyclists-Adult	Bicyclists-Children	Runners	Other	
8:00-9:00 AM						
Sycamore Valley	9	24	5	5	3	46

Crow Canyon	4	34	0	7	0	45
Bollinger Canyon	10	25	0	3	0	38
Total	27	94	0	16	0	137
Mode split	20%	68%	0%	12%	0%	100%
10:00-11:00 AM Saturday						
Sycamore Valley	19	32	0	15	0	66
El Capitan	19	45	6	20	1	91
Crow Canyon	18	47	6	21	1	93
Bollinger Canyon	27	43	0	8	2	80
Total	83	167	12	64	4	330
Mode split	25%	51%	4%	19%	1%	100%

Notes:

1. El Capitan was counted only on Saturday.
 2. Calculated as the sum of each user type divided by the total use for each period.
- Fehr & Peers, 2008.

The trail counts show that use at each of the locations was highest during the Saturday peak hour. During the morning and mid-day peak hours, use was highest at Bollinger Canyon Road. During the evening peak hour, use was highest at Sycamore Valley Road. During the Saturday peak hour, use was highest at Crow Canyon Road. In terms of user types, there were more pedestrians than other types in the morning peak hour (although there were almost as many cyclists), and more bicyclists than other user types in the mid-day, evening, and Saturday peak hours. It is important to note that these counts represent only those trail users who cross the study intersections; the counts do not include people on the trail in between the crossings.

Vehicle Volumes

In addition to the trail user counts, Fehr & Peers collected recent vehicle counts from the Town of Danville, City of San Ramon, and other sources. This data included weekday vehicle counts adjacent to each proposed overcrossing location during the morning and evening peak hours, and twenty-four hour weekday vehicle counts adjacent to each overcrossing location. Table 2 highlights the peak hour vehicle volumes crossing the trail. The total existing vehicle volumes are shown in **Figure 3**.

TABLE 2		
EXISTING PEAK HOUR VEHICLE VOLUMES CROSSING TRAIL		
Location	AM	PM
Sycamore Valley Road	2,363	2,409
Crow Canyon Road (west)	3,224	3,513
Crow Canyon Road (east)	3,000	3,255
Crow Canyon Road (average) ¹	3,112	3,384
Bollinger Canyon Road	2,796	3,550
Notes: 1. Because there is not a vehicle intersection at Crow Canyon Road and the trail, volumes from two adjacent intersections were averaged. Fehr & Peers, 2008.		

The vehicle volumes show that during the morning and evening peak hours, about the same volume of traffic crosses the trail on Crow Canyon Road and Bollinger Canyon Road, while fewer vehicles cross the trail on Sycamore Valley Road.

Fehr & Peers determined the key origins and destinations for trail users, based on field observations and map review. These origins and destinations are shown on **Figure 4** and listed below (uses with particularly direct trail access are starred below).

Safety and Other Observations

Observations of typical use patterns, safety issues, and other characteristics of the trail were collected at each proposed crossing location. These are summarized for each location below and shown in **Figure 5**.

Sycamore Valley Road

Typical weekday use at the Sycamore Valley Road crossing in the morning was groups of cyclists and single pedestrians and joggers. In the mid-day, the typical user was a lone cyclist. In the evening, the typical user was a male recreational cyclist. Overall, the trail was not crowded and use seemed low. A few students were observed using the trail in the morning, but none were observed in the mid-day period.

Several pedestrians and runners were observed approaching the crossing, particularly from the north, and turning back. It was assumed that these were recreational users who used the intersection as a convenient turn-around point for their workout. The long signal cycle (observed to be about 80 seconds) was also assumed to be a deterrent to continuing along the trail. A countdown signal could be helpful for pedestrians approaching the crosswalk.

We observed that trail users crossing at Sycamore Valley Road can get cut off in the crosswalk by northbound right-turning vehicles. This is particularly an issue for persons crossing northbound, as vehicle drivers tend to focus on traffic to their left and are less likely to look to their right for people in the crosswalk.

Use on Saturday was substantially higher than on the weekday, and trail users were relatively evenly split between pedestrians and cyclists. Several groups of people were observed. Some cyclists had child carriers attached to their bikes, and some people were observed running with dogs.

Crow Canyon Road

Weekday use at the Crow Canyon crossing was relatively low overall, though the evening period had higher use than the morning or mid-day. A few students were observed using the trail in the morning, but none were observed in the mid-day period. Crow Canyon Road is signed as a Class

III bike route, but few cyclists were observed on the roadway. A few cyclists were observed riding from the east and accessing the trail to head south.

As at Sycamore Valley Road, several trail users (particularly pedestrians) were observed to approach the intersection but turn around before crossing. The long signal cycle (observed to be 90 seconds or more) was assumed to be a deterrent to continuing along the trail. The countdown signal, which provides 24 seconds to cross, was helpful to trail users approaching the intersection.

Many users were observed jay-walking, most likely due to the long cycle length, the median, and the lack of north-south vehicle traffic. The long wait and resulting jay-walking creates frustration for trail users as well as drivers along Crow Canyon Road. As an example, a cyclist waited for a gap in traffic, crossed to the median, pushed the push-button there, waited for a second gap, and crossed to the far side. After he finished crossing, the walk phase began and drivers had to wait for no apparent reason.

Bollinger Canyon Road

Typical weekday use at the Bollinger Canyon Road crossing included single users and small groups of pedestrians and cyclists. Several users walked from the trail to Central Park and the unpaved trail adjacent to it. Several people came to or from the east on the sidewalk. Overall, this portion of the trail had moderate use, with higher use in the morning.

On Saturday, Bollinger Canyon Road seemed to have more vehicle traffic than Sycamore Valley Road or Crow Canyon Road. Trail use was slightly lower than points further north on the trail.

Few school-aged children were observed on the trail in the morning and mid-day. However, a large group of runners from the California High School cross-country team ran along the trail in the afternoon, crossing Bollinger Canyon northbound at about 3:45 PM and then returning southbound at about 4:00 PM. There were about 25 runners in total, plus two coaches on bicycles. The runners clustered in groups of about 15 while waiting for the signal.

As at Crow Canyon Road, several instances of jay-walking were observed. The long signal cycle (observed to be about 80 seconds) was clearly frustrating for many people, who became impatient and pushed the push-button repeatedly. Bicyclists were particularly likely to cross against the signal, because they were able to cross quickly. Others, including runners and cyclists, crossed against the signal to the median and waited for gaps in traffic to complete their crossing. However, the median is not wide enough to protect a bicyclist from vehicle traffic.

Another safety issue that was observed is that eastbound vehicles on Bollinger Canyon Road backed up in the evening, blocking the crosswalk. This was observed twice in five minutes around 5:30 PM on a weeknight. Trail users were forced to walk or bike through traffic to cross, and some cyclists took advantage of the stopped traffic to cross against the signal. The sidewalk on the north side of the road is narrow, making it difficult to turn onto the crossing from the trail, and vice versa.

Summary of Observations

Overall, few conflicts were observed between trail users; rather, the key issues are conflicts between trail users and vehicles, and the long signal cycles at the crossings. Both trail users that

currently jay-walk across the intersection and those that turn around to avoid the crossing would benefit from an overcrossing.

Collision Data

Data provided by the City of San Ramon and the California Highway Patrol (SWITRS data) shows that between 2002 and 2007, there were five bicycle- or pedestrian-related collisions at intersections on the Iron Horse Trail in the study area (between Sycamore Valley Road and Bollinger Canyon Road). All five of these involved an automobile and a bicycle. Three occurred at or near the intersection of the trail and Crow Canyon Road, while two occurred at the intersection of the trail and Greenbrook Drive. Of the three collisions at Crow Canyon Road, one involved a bicyclist under the influence of alcohol colliding with a stopped vehicle; and two involved a vehicle not obeying the traffic signal and pulling into the crosswalk, hitting the bicyclist. The police reports for the two collisions at Greenbrook Drive cite violation of the automobile's right of way by the bicyclist as the primary collision factor.

2. FUTURE USE PROJECTIONS

Future use of the trail is affected by several factors. These include employment growth, residential growth, and other development along the corridor, as well as changes to the trail itself, such as the provision of overcrossings, that make it more attractive. Fehr & Peers developed projections of future use on the trail based on these factors, each of which is outlined below.

Planned Development/Growth

There are several developments planned along the corridor. These include the Rose Garden (apartments, office, and retail), Charlotte Wood area housing, Crow Canyon area condominiums, and the San Ramon City Center (condominiums, office, retail, hotel, cinema, and library). These are highlighted in **Figure 6**. Several new connections to the trail are planned as part of these developments. The Rose Garden project includes two trail connections, one to the commercial portion of the project and a second to the residential units through a private gate. The residential development near Charlotte Wood School will include a connection between the trail and Osage Park, and new connections are planned between the trail and the City Center project, both at Bishop Drive (at the northern boundary of the site) and at Bollinger Canyon Road. A proposed new connection between the trail and Central Park is also planned as part of the City Center project.

Based on the planned development, Fehr & Peers estimated the number of new employees and residents along the corridor. These calculations and the assumptions used are summarized in Table 3. In total, we estimate that there will be about 3,700 new employees and 1,000 new residents along the corridor with these projects. The majority of the new jobs and housing is planned to occur as part of the City Center project adjacent to Bollinger Canyon Road.

TABLE 3			
DEVELOPMENT PLANNED ALONG THE STUDY CORRIDOR			
Development	Size (sq ft or DU)	New Employees	New Residents
Rose Garden			
Office ¹	29,440	118	
Retail/Restaurant ²	56,640	113	
Apartments ³	55		93
City Center

Hotel ⁴	169 rooms	152	
Cinema ⁵	6 screens	31	
Library ⁶	35,340	35	
Condominiums ³	488		830
City Center/Bishop Ranch			
Office Expansion ¹	487,117	1,949	
Other			
Charlotte Wood Homes ⁷	9		24
Crow Canyon Condos ³	35		59
Total		3,725	1,006
Notes:			
1. Assumed 250 sq ft/employee for offices.			
2. Assumed 500 sq ft/employee for retail & restaurants.			
3. Assumed 1.7 persons per unit for apartments and condominiums			
4. Assumed 0.9 employees per hotel room, based on the ITE <i>Trip Generation Handbook</i> , page 541.			
5. Assumed about 5.2 employees per screen, based on ITE <i>Trip Generation Handbook</i> rates for multiplex cinema.			
6. Assumed 1000 sq ft/employee for library.			
7. Assumed 2.63 persons per house, based on 2000 Census average household size for San Ramon.			
Sources: <i>San Ramon City Center Environmental Impact Report</i> , Town of Danville, City of San Ramon. Fehr & Peers, 2008.			

To determine the effect of this development on use of the trail, we used the following assumptions:

- 77 percent of the new residents living along the trail will work, and three percent of those who work will use the trail on their way to work and back. According to the 2000 Census, 77 percent of San Ramon's population is of working age, and 1.2 percent of San Ramon residents currently walk or bike to work. We doubled the city-wide walk and bike mode share for the new residents due to their proximity to the trail, and to account for residents who would walk or bike to the San Ramon Transit Center or the Sycamore Park and Ride, which provide transit connections to employment centers throughout the Bay Area.

The percentage is not higher because many work locations may not be accessible by the trail or transit.

- 19 percent of the new residents will be students (ages 5-18), and 20 percent of the new students living along the trail will use it to get to school and back. The proportion of students within the new households is based on 2000 Census data for San Ramon. According to the 2003 Contra Costa Countywide Bicycle and Pedestrian Plan, in most communities, between 5 and 20 percent of students bicycle to school. We assumed the high end of this range due to the proximity of schools and new residences to the trail, and also to include students who walk to school.
- Three percent of new employees working along the trail will use trail to get to work and back. Based on 2000 Census data, about 1.3 percent of employees working in San Ramon walk or bike to work. However, between 2.5 and 2.8 percent of employees at Bishop Ranch currently walk or bike to work, based on a 2006 survey. We assumed a percentage consistent with commute patterns for Bishop Ranch employees, because the new work locations are all directly adjacent to the trail.
- 5 percent of new residents will use the trail on Saturday during the peak hour. This estimate is based on professional judgment.
- We distributed these new trail trips among the three proposed overcrossing locations to account for the different concentrations of development at each location:
 - Because most of the new employment is concentrated near Bollinger Canyon Road, we assumed that 100 percent of the new employees' trips would cross that roadway. Because we don't know where the new employees will be coming from, we assumed that 50 percent would also cross Crow Canyon Road, and 10 percent would also cross Sycamore Valley Road. This roughly reflects each intersection's proportion of the new jobs and proximity to new job locations.
 - Because the residential development is spread along the corridor, we assumed that 100 percent of the new residents' Saturday trips and workday trips would cross each of the three proposed overcrossing locations.

Because the residential development and schools are spread along the corridor, we assumed that 100 percent of the new students' trips would cross each of the three proposed overcrossing locations. Table 4 summarizes the projected effects of planned development on future trail use, both for each of the four peak hours studied, and at each of the three proposed overcrossing locations. Overall, we project increases at each location of about 70 to 170 users in the morning peak hour; 40 users in the mid-day peak hour, 35 to 135 users in the evening peak hour, and 50 users in the Saturday peak hour. The largest increases are projected to occur at Bollinger Canyon Road.

**TABLE 4
 PROJECTED FUTURE TRAIL USE FROM PLANNED DEVELOPMENT**

User Type	Total	Percent using Trail	Peak Hour			
			Morning	Mid-Day	Evening	Saturday
Residents ¹	1,006	5%				50
Working Residents ²	775	3%	23		23	
Students ³	190	20%	38	38		
Employees ⁴	3,725	3%	112		112	
Total			173	38	135	50
Crossing Location	Distribution of Use		Morning	Mid-Day	Evening	Saturday
Sycamore	10% of employees; 100% of others		72	38	34	50
Crow Canyon	50% of employees; 100% of others		117	38	79	50
Bollinger Canyon	100% of employees; 100% of others		173	38	135	50
Notes:						
1. Reflects residents of planned housing along the trail.						
2. Reflects proportion of new residents who would work.						
3. Reflects proportion of new residents who would be students.						
4. Reflects employees of new office, retail, and other development along the trail.						
Fehr & Peers, 2008.						

Effects of Proposed Overcrossings

In addition to the development planned along the trail, we considered the effect of the proposed overcrossings on trail use. As described above, the major intersections are often treated by trail users as “turn-around points,” either to avoid crossing vehicle traffic or to avoid waiting for the walk signal. Based on observations during a weekday morning, up to about 25 percent of trail users approaching the proposed overcrossing locations turned around without crossing. These were assumed to be recreational users, but the “barrier effect” of the existing at-grade intersections also likely reduces trail use by those who might otherwise use the trail to get to school, work, or other destinations.

Constructing an elevated overcrossing at any of the three proposed locations would reduce this “barrier effect” and thereby increase recreational use of the trail, as well as transportation use by students, employees, and residents. To account for this effect, we assumed that trail use by the estimated future recreational users at each crossing would increase by 25 percent if an overcrossing were provided. Based on field observations, recreational use accounts for about 65 percent of morning peak hour users; 75 percent of mid-day and evening peak hour users; and

100 percent of Saturday peak hour users. We applied the 25 percent “barrier effect” increase to these proportions of projected future users. The combined effects of planned development and the construction of the overcrossings are shown in Table 5.

TABLE 5

Notes:					
1. Represents an increase in use of 25 percent by recreational users.					
Fehr & Peers, 2008.					

Other Factors

In addition to future development and the proposed overcrossings, other factors could affect future trail use. These include changing values and lifestyles, such as increased awareness of healthy transportation or interest in recreation, and policies or programs, such as Safe Routes to School initiatives. These effects were not quantified, but could increase trail use above the projections presented here.

3. PRELIMINARY FINDINGS

Projected Future Trail Volumes

Based on the projections discussed above, we would expect between 135 to 270 trail users during the morning peak hour, 70 to 90 trail users during the mid-day peak hour, 100 to 200 trail users during the evening peak hour, and 150 to 180 trail users during the Saturday peak hour at the proposed overcrossing locations. The highest weekday use is projected to occur at Bollinger Canyon Road, while the highest Saturday use is projected to occur at Crow Canyon Road. The overall highest use is projected to occur during the morning peak hour at Bollinger Canyon Road.

The projected total and percentage growth at each proposed overcrossing location is summarized in Table 6. The largest growth in trail use is expected to occur at Bollinger Canyon Road, with between 100 and 370 percent growth, representing between 50 and 210 new users per peak hour. On average, growth at Bollinger Canyon Road is expected to be above 250 percent in the peak hours. Growth at Crow Canyon Road is expected to be similar, with between 90 and 420 percent growth, representing between 50 and 140 new users per peak hour. On average, growth at Crow Canyon Road is expected to be about 240 percent in the peak hours. Growth at Sycamore Valley Road is expected to be slightly less, with between 90 and 200 percent growth, representing between 50 and 100 new users per peak hour. On average, growth at Sycamore Valley Road is expected to be about 150 percent in the peak hours.

The projected future volumes at the proposed overcrossing locations are shown in **Figure 7**.

Projected Future Vehicle Volumes

As a comparison to the projected future trail use, we analyzed future vehicle volumes at the three proposed overcrossing locations, using data from recent traffic studies. This data is shown on **Figure 8** and summarized in Table 7. **Figure 9** compares the projected growth in trail use to projected increases in vehicle traffic at the three proposed overcrossing locations.

TABLE 7 PROJECTED VEHICLE TRAFFIC GROWTH CROSSING TRAIL						
Location	Existing Volumes		Future Projected Volumes		Percent Growth	
	AM	PM	AM	PM	AM	PM
Sycamore ¹	2,363	2,409	2,901	3,085	23%	28%
Crow Canyon ²	3,112	3,384	3,786	4,281	22%	26%
Bollinger Canyon ²	2,796	3,550	3,747	5,294	34%	49%

Notes:
 1. Data from *Elworthy Ranch Environmental Impact Report*: Existing and 2020 volumes with project.
 2. Data from *San Ramon City Center Environmental Impact Report*: Existing and 2020 volumes with project.
 Fehr & Peers, 2008.

As shown in Table 7, currently, Crow Canyon Road has the most vehicle traffic crossing the trail in the morning peak hour, and Bollinger Canyon Road has the most vehicle traffic crossing the trail in the evening peak hour. In the future, Crow Canyon Road and Bollinger Canyon Road are expected to have about the same amount of vehicle traffic crossing the trail in the morning (about 3,700 vehicles per hour), and Bollinger Canyon Road is expected to have the highest amount of traffic crossing the trail in the evening, with about 5,300 vehicles per hour.

Future Operations

Overcrossings

Future operations of the proposed overcrossings will depend on the width and design of the overcrossings. We understand that the design team has assumed a total width of 14 feet for the overcrossing structure, and a total length of approximately 1,000 feet. Fehr & Peers analyzed the operations of such a structure using the Federal Highway Administration’s (FHWA’s) recent Shared-Use Path Level of Service Calculator. The calculator estimates the operations of a shared-use path based on total one-way user volume, proportions of various user types, path width, and the presence of a centerline¹. The calculator was developed based on bicyclists’ perceptions of comfort and freedom on various trail types, and has the following characteristics:

- It prioritizes bicyclists’ ability to maintain an optimum speed and maneuver freely.
- It is designed for use on a minimum 0.25-mile (1,320-foot) long trail segment.
- It assumes a peak hour factor of 0.85, meaning that it bases the analysis on a peak 15-minute period with 15 percent higher use than if the hourly volume were evenly split across the whole hour.
- It assumes a bicyclist speed of 12.8 miles per hour.
- The score (level of service) is based on the trail’s peak use, and thus represents a worst-case scenario.

¹ See <http://www.tfhr.gov/safety/pedbike/pubs/05138/>

Although the tool is designed for bicycle-pedestrian paths rather than bridges, it can provide information about the relative performance of the bridge at various widths, given the level of use and mode split expected on the bridge. We assumed that the overcrossings' effective travelway width would be between 10 and 14 feet, due to railings and the need for clearance from the edge. Widths of less than 10 feet are not recommended. Generally, an overcrossing should be at least as wide as the trail, which in this case is typically about 10 feet.

We tested several widths to determine which would operate acceptably, using the highest projected volume and user mix for each overcrossing location. The volumes and user mix tested are outlined in Table 8, and the results of the analysis are shown in Table 9.

TABLE 8			
PEAK HOUR VOLUME AND USER MIX ASSUMPTIONS			
	Sycamore Valley Road	Crow Canyon Road	Bollinger Canyon Road
Highest Peak Hour	Saturday	Weekday PM	Weekday AM
One-way volume	74	94	135
Mode Split (based on observed corridor mix during highest peak hour):			
Adult bicyclists	51%	68%	40%
Pedestrians	25%	20%	47%
Runners	19%	12%	7%
Child Bicyclists	4%	0%	4%
Other	1%	0%	2%
Fehr & Peers, 2008.			

Based on this analysis, both the Sycamore Valley Road and Crow Canyon Road overcrossings are projected to operate acceptably at effective widths of 10 feet or greater. Effective widths of 11 feet would provide significant room to absorb additional users. The Bollinger Canyon Road overcrossing is projected to operate acceptably at effective widths of 12 feet or greater. However, an effective width greater than 14 feet would be needed to provide significant room to absorb additional users. An effective width of 11 feet or less at the Bollinger Canyon Road overcrossing would likely cause peak period travel speeds to be reduced.

It should be noted that bicyclists on the overcrossings will ride more slowly than they would on a path, at least on the "uphill" ramp. Therefore, the relative speed differences between bridge users, and thus the impact of pedestrians on bicyclists' level of service, may be less dramatic than the tool suggests. As a comparison, the Ygnacio Valley Road overcrossing is approximately ten feet wide and generally operates acceptably, based on observations and discussions with East Bay Regional Park District staff. However, it was noted that the ten-foot width feels tight when there are bicyclists traveling in both directions and a third bicyclist passing in between.

11	No	2.94	D
10	No	2.05	E
Notes:			
¹ According to the tool user guide, LOS A-C can be considered acceptable and D-F can be considered "degraded." A (4.0 or greater) = Excellent; optimum conditions for individual bicyclists; retains ample space to absorb more users of all modes. B (3.5 to 4.0) = Good bicycling conditions; retains significant room to absorb more users. C (3.0 to 3.5) = Fair; Trail has at least minimum width to meet current demand and to provide basic service to bicyclists. More pedestrians, runners, or other slow-moving users will begin to diminish LOS for bicyclists. D (2.5 to 3.0) = Poor; nearing functional capacity. Peak period speeds likely to be reduced by levels of crowding. E (2.0 to 2.5) = Very poor; trail has reached functional capacity; peak period travel speeds are likely to be reduced. F (less than 2.0) = Significant user conflicts should be expected. Source: <i>Shared-Use Path Draft Level of Service Calculator</i> , provided by FHWA staff; Fehr & Peers 2007.			

Pedestrian and Bicycle Access to Adjacent Land Uses

Currently, trail users have relatively easy access to land uses adjacent to the trail, such as the residential areas near Sycamore Valley Road, the businesses along Crow Canyon Road, and the San Ramon Central Park, Marketplace shopping center, and offices adjacent to Bollinger Canyon Road. It will be important to preserve connections between the trail and adjacent uses if the proposed overcrossings are constructed. Additionally, connections between the trail and planned new development should be incorporated into the overcrossing planning.

For example, many trail users were observed traveling between the trail and the San Ramon Central Park. However, the path just north of Bollinger Canyon Road that connects the park to the trail will likely be inaccessible by people on the overcrossing. While there are additional

connections between the trail and park further north, they require users to travel further out of their way. Preserving parallel at-grade crossings and providing stairs or a more direct ramp from the overcrossing should be considered to facilitate access to the park and other adjacent uses. Similarly, access between the overcrossings and planned development, such as the San Ramon City Center project, should be made as convenient as possible.

Vehicle Operations

Overview

Vehicle operations are typically classified by a level of service grading system that qualitatively characterizes traffic conditions associated with varying levels of vehicle traffic, ranging from level of service (LOS) A (indicating free-flow traffic conditions with little or no delay experienced by motorists) to LOS F (indicating congested conditions where traffic flows exceed design capacity and result in long queues and delays). LOS A to C are generally considered satisfactory service levels, while the influence of congestion becomes more noticeable (though still considered acceptable) at LOS D. LOS E and LOS F are generally considered to be unacceptable, though some jurisdictions consider LOS E to be acceptable in certain areas (like a downtown central business district) in recognition of the positive effect of traffic congestion in promoting the use of transit, bicycling, and walking.

Based on recent studies, the existing level of service for vehicles at intersections adjacent to the three proposed overcrossing locations ranges from LOS A to LOS C in the morning peak hour, and from LOS A to LOS D in the evening peak hour. Future levels of service at these intersections are estimated to be similar, ranging from LOS A to LOS C in the morning peak hour and from LOS B to LOS D in the evening peak hour. These levels of service include planned roadway improvements, including widening Bollinger Canyon Road at Alcosta Boulevard to three through lanes in each direction and widening Bollinger Canyon Road at Bishop Ranch East to four through lanes in both directions with dual left turn lanes.² The existing and projected future LOS for key intersections in the study area is shown in Table 10.

The Bollinger Canyon Road/Alcosta Boulevard intersection is expected to operate the most poorly in the future, with LOS D in the evening peak hour. However, it should be noted that these analyses used the CCTALOS methodology, which measures volume versus capacity, and does not account for signal timing or pedestrian volumes. Based on recent observations of peak hour congestion, service levels can be worse than indicated by the planning-level CCTALOS methodology.

Effects of Removing At-Grade Trail Crossings

Currently, the at-grade crossings affect vehicle operations by stopping traffic whenever the pedestrian walk signal is activated (a pedestrian signal “call”). Based on the trail counts, there are currently between 30 and 60 trail users crossing the three intersections during the morning and evening peak hours. Since some of these users are in groups, this results in a pedestrian signal “call” about once every two minutes. This is unlikely to significantly affect vehicle operations along any of the three roadways. However, the projected growth in trail use and vehicle traffic will likely deteriorate operations for both vehicles and trail users.

² Note that this geometry, which was assumed in the City Center EIR, is different than the City’s most recent design plans for Bollinger Canyon Road at the Iron Horse Trail, as described later in this report.

The effects of removing the at-grade crossings on vehicle traffic depend on the configuration of the crossing. At Sycamore Valley Road and Bollinger Canyon Road, the crossings are located at roadway intersections. If the at-grade crossings are removed, trail users could cross the roadway at any time, but vehicles on the main roadway would continue to stop for cross-traffic. Existing peak hour traffic volumes on Bishop Ranch East at Bollinger Canyon Road and Camino Ramon at Sycamore Valley Road are relatively low, but future peak hour volumes on these cross-streets are expected to be more substantial, particularly with the proposed addition of a southbound leg on Bishop Ranch East and evening traffic from the City Center project, as well as northbound traffic diverted from the freeway onto Camino Ramon.

Note that the Level of Service analysis was done using the CCTALOS methodology.</i> Fehr & Peers, 2008.				

The benefits of removing the at-grade crossings could include improved coordination of signals along the roadways, allocation of additional green signal time to heavy vehicle movements, and reduction of vehicle back-ups such as those observed on eastbound Bollinger Canyon Road in the evening.

The existing trail crossing at Crow Canyon Road is a mid-block crossing with no intersecting vehicle traffic. Therefore, if the at-grade crossing were removed, trail users could cross the roadway at any time, and the traffic signal on Crow Canyon Road could be removed. In this case, removal of the at-grade crossing is likely to allow improved coordination of signals along the roadway, allocation of additional green signal time to heavy vehicle movements, and reduction of vehicle back-ups. The overall benefit to vehicle traffic may be small because the existing number of trail crossings is relatively low, but the benefit would be greater than at the other two locations.

At all locations, if the at-grade crossings were preserved, a high proportion of trail users would use the overcrossings rather than wait for the pedestrian signal. Trail users accessing uses directly adjacent to the intersection (such as Central Park or parts of the City Center project adjacent to Bollinger Canyon Road) may prefer the at-grade crossing, and continue to use it. The effect on traffic flow along Bollinger Canyon Road if a few users continue to use the at-grade crossing would be negligible, however.

Traffic Operations Analysis Results

Fehr & Peers tested the effects of removing the at-grade trail crossing on Bollinger Canyon Road on vehicle operations. This operations analysis was done using the Synchro software, which implements the Transportation Research Board's 2000 Highway Capacity Manual (HCM) method. HCM-based operations analysis uses traffic volumes, lane geometry, signal timing, and pedestrian activity to estimate the average delay (measured in seconds per vehicle) experienced by motorists traveling through an intersection. The HCM method was used because it accounts for pedestrian volumes and is considered a state of the practice tool. Synchro files developed by Kimley-Horn for the City Center project were provided and used for the baseline scenario, with minor adjustments described below, in order to be consistent with previous analyses of the intersection. The Synchro output is provided in Appendix C.

The following two scenarios were tested:

1. Future (2020) PM Baseline. This scenario assumes a widened Bollinger Canyon Road and the construction of a southbound leg of the intersection to serve the City Center project. The intersection geometry was based on plans provided in March, 2008 by Kimley-Horn staff. These plans include a left turn lane, three through lanes, and a shared through-right turn lane on eastbound Bollinger Canyon Road; a left turn lane, four through lanes, and a right turn lane on westbound Bollinger Canyon Road; a left turn lane and a shared through-right turn lane on northbound Bishop Ranch East; and two left turn lanes and a shared through-right turn lane on southbound Bishop Ranch East. Future vehicle volumes were based on the 2020 With Project Volumes presented in Exhibit 4.12-14a of the City Center Draft Subsequent EIR (DMJM Harris|AECOM, July 2007), with adjustments to add minimal northbound and southbound through traffic on Bishop Ranch East. The existing crosswalk on the northbound leg of the intersection was assumed to remain, while the existing crosswalk on the westbound leg of the intersection was removed, based on information from City staff. In addition, crosswalks on the eastbound and southbound legs were added, based on information provided by City staff. The projected PM peak hour trail crossing volume (shown in Table 5 of this report) was assumed for the crosswalk on the eastbound leg of the intersection. The intersection's signal timing was based on analyses conducted by Kimley-Horn for the City Center project (as provided by Kimley-Horn staff) and optimized to accommodate the future pedestrian and vehicle volumes at the intersection.
2. Future (2020) PM—With Overcrossing. This scenario assumes the same geometry and vehicle volumes as the Baseline scenario, but removes the crosswalk on the eastbound leg of the intersection, and assumes that pedestrians would use the overcrossing instead. The intersection's signal timing was re-optimized to accommodate the vehicle volumes at the intersection.

In the Baseline scenario, 38 seconds is required to provide enough time for northbound and southbound pedestrians to cross the widened Bollinger Canyon Road (5 seconds of “Walk” and 33 seconds of “Flashing Don’t Walk”). The “Flashing Don’t Walk” time is based on a curb to curb width of 116 feet (based on plans provided by Kimley-Horn) and a walking speed of 3.5 feet per second, which is consistent with best practices. This extends the green signal time for the parallel northbound and southbound approaches, which have relatively low vehicle volumes compared to Bollinger Canyon Road, and shortens the effective green time available for Bollinger Canyon Road. The overall level of service for the intersection is D, with an average delay of 52 seconds per vehicle. Vehicle queues for the eastbound through movement extend approximately 850 feet.

In the With Overcrossing scenario, northbound and southbound pedestrians are assumed to use the overcrossing. Therefore, the green time needed for pedestrians to cross Bollinger Canyon Road can be reallocated to serving the heavy vehicle volumes on Bollinger Canyon Road. The overall level of service for the intersection is C, with an average delay of 20 seconds per vehicle. Vehicle queues for the eastbound through movement extend about 130 feet, which is well within the available storage length between the Bishop Ranch East intersection and the upstream intersection at Camino Ramon. This is a reduction of 32 seconds of delay per vehicle, on average, and a decrease in the eastbound queue length of about 720 feet. While the effects of providing overcrossings at other locations would vary, in general drivers would experience less delay and shorter back-ups, particularly on the major street when the crossing is wide and minor-street volumes are relatively low.

Summary

A summary of the issues and expected benefits of the proposed overcrossings is presented below for each of the three locations. Conditions vary between the three proposed overcrossing locations, but trail users at each location would benefit from an overcrossing.

Sycamore Valley Road

The Sycamore Valley Road trail crossing currently has moderate use, similar to that at Crow Canyon Road but less than that at Bollinger Canyon Road. Vehicle volumes crossing the trail are lower at Sycamore Valley Road than at the other locations. Trail users were observed turning around before the crossing, likely to avoid the long signal cycle and multi-lane crossing. There are potential safety issues associated with northbound right-turning vehicles cutting off people in the crosswalk. With the planned Rose Garden development and the proximity of the Park & Ride lot, an overcrossing at this location has the potential to serve local residents, workers, and shoppers, as well as commuters and recreational users along the corridor. An overcrossing would also increase safety and convenience for trail users. It would improve traffic operations due to fewer pedestrian calls at the traffic signal, although to a lesser extent than would be seen at the Bollinger Canyon Road location.

Crow Canyon Road

The trail crossing at Crow Canyon Road is the only mid-block crossing of the three studied. Its current trail use is similar to that at Sycamore Valley Road but less than that at Bollinger Canyon Road. Crow Canyon Road currently has the highest vehicle volume crossing the trail in the morning peak hour, and has similar volumes to Bollinger Canyon Road in the evening peak hour. More bicycle-vehicle collisions have occurred at the Crow Canyon Road crossing over the last six years than at the other locations, based on available data. The long signal cycle and lack of cross-traffic results in many trail users jay-walking. Several users were observed turning around

before the crossing to avoid waiting for the signal. This location serves as a mid-point between the residential areas to the north and the office parks to the south. An overcrossing at this location would serve both nearby residents and employees, improve safety and convenience for trail users, and improve traffic operations along the corridor by removing a trail crossing (and traffic control point) from the roadway.

Bollinger Canyon Road

The Bollinger Canyon Road crossing currently has the highest trail use of the three crossings studied, as well as the highest vehicle volumes crossing the trail in the evening. Trail users here face long signal cycles and a multi-lane crossing, similar to the other crossings. Many trail users jay-walk. In addition, there are safety and vehicle operations issues in the evening, when eastbound vehicles back up, blocking the crosswalk. The largest increases in development, vehicle traffic, and trail use are expected at this location, due in large part to the San Ramon City Center project. Bollinger Canyon Road is planned to be widened to accommodate expected traffic associated with the City Center. The planned increase in residents, employees, shoppers, and other activity around Bollinger Canyon Road, as well as existing destinations such as Central Park, the Marketplace, and Bishop Ranch, provide many potential users for an overcrossing. An overcrossing at this location would improve safety and convenience for trail users, and improve traffic operations along the corridor.
